**merger<sup>2</sup>** (mēr'jēr), *n.* [*< OF. merger*, inf. as noun, a merging; see *merge*.] 1. In the law of conveyancing, the sinking or obliteration of a lesser estate in lands, etc., resulting when it is transferred without qualification to the owner of a greater estate in the same property (or the like transfer of the greater estate to the owner of the lesser), if there be no intermediate estate. At common law the lesser estate was not deemed to be added to the greater, but to be extinguished, so as to free the greater estate from the qualification or impairment which the existence of the lesser estate had constituted. Thus, if an owner of the fee of land on which there was an outstanding lease, owned by another person, acquired the lease, the lease was thereby annulled, and he thereafter held simply as owner of the fee. It resulted sometimes that, if his title to the fee proved defective, he could not avail himself of any claim under the lease.

Clovis, invading the Roman part of Gaul in A. D. 486, founded the Merovingian or first race of French kings (several often reigning at the same time in different parts of France), which was succeeded by the Carolingian dynasty in 751 or 752. Some suppose *Merowig* or *Merovius* to have been the patronymic of the family or clan of Clovis, derived from a more remote ancestor. — **Merovingian writing**, a variety of cursive script full of flourishes and difficult enunciations and combinations of letters, peculiar to the Merovingian period in France; used in many documents still in existence.

The *writing* of the Frankish empire to which the title of *Merovingian* has been applied had a wider range than the other national hands. It had a long career both for diplomatic and literary purposes. In this writing, as it appears in documents, we see that the Roman cursive is subjected to a lateral pressure, so that the letters received a curiously cramped appearance, while the heads and tails are exaggerated to inordinate length.

It. *mesmerismo*); so called from Friedrich Anton (or Franz) *Mesmer* (1733-1815), a German physician, who propounded the theory in 1778, in Paris.] 1. The doctrine that one person can exercise influence over the will and nervous system of another, and produce certain phenomena by virtue of a supposed emanation, called *animal magnetism*, proceeding from him, or simply by the domination of his will over that of the person operated on. Originally Mesmer professed to produce his results by the operation of actual magnets, but all such apparatus has long been abandoned, and those who profess belief in magnetism as the cause of the phenomena exhibited refer it to the body of the mesmerist. The actual phenomena believed to be produced by this so-called animal magnetism are now explained by modern hypnotism, or artificial somnambulism, which within recent years has been the subject of extended research. It is now generally admitted that there is no force of any kind transmitted from the operator to the person operated upon, and many of the pretensions of mesmerism, such as clairvoyance, are rejected. The term *mesmerism* is still popularly used, often more or less synonymously with *hypnotism*, but more frequently in its original or an allied sense. Other terms used more or less synonymously with either *mesmerism* or *hypnotism* are *bradism* (after the English surgeon Braid, who first studied the phenomena of mesmerism scientifically) and *neurohypnotism*.

The marked diagonals are all parallel. To use the instrument, all the intersections, each formed of the diagonal of one rectangle and the overlapping edge of the next one, are brought, by the sliding along of the rectangles, into one straight line with one extremity of the diagonal of the uppermost rectangle and a point on the exposed edge of the lowermost whose distance from the extremity of the diagonal on the same edge measures the quantity whose root is to be extracted. Then

the corresponding distance on the uppermost rectangle is the root multiplied by that of the common altitude of the rectangles, which last is supposed to be known. The exponent of the root is equal to the number of rectangles employed. The mesolabe was invented by Eratosthenes, about 200 to 250 years before Christ.

II. *n.* One of the bones of the metacarpus. They are not more than five in number, and are reckoned as first, etc., from the radial or thumb side to the other. When reduced in number they always disappear from the sides, so that when but three are left the first and fifth are gone; when there is but one it is the third or middle metacarpal. Two or more may fuse into one bone, as in the metacarpus of a cloven-footed quadruped, as the ox. In recent birds, all of which have three ankylized metacarpals, the compound bone is further complicated by fusion with it of certain carpal bones, constituting a carpo-metacarpus, like the tarsometatarsus of the foot.

**metacarpale** (met-a-kär-pä'le), *n.*; pl. *metacarpalia* (-li-ä). [NL.; see *metacarpal*.] A metacarpal bone; one of the metacarpals.

In the horse it is the part of the fore leg between the so-called knee and the fetlock-joint, and has but one functional bone.

The term is specifically applied to the point where the vertical line passing through the center of buoyancy of a ship, in the position of equilibrium, meets the vertical drawn through the new center of buoyancy when the ship is slightly listed to one side or the other. The term was introduced into hydrostatics by Pierre Bouguer, a French geodesist (1698–1758). Also called *center of cavity*.

**metagenesis** (met-a-jen'e-sis), *n.* [*NL. < Gr. μετᾱ*, beyond, after, + *γενεα*, production: see *genesis*.] In *biol.*, that modification of parthenogenesis or alternate generation which is exhibited when an organism passes from the egg to the imago through a series of successively generated individuals differing from one another in form: distinguished by Owen from *metamorphosis*, or the transformation of any one individual by the modification of its form as a whole. Metagenesis of one or another kind is exhibited by some insects, as aphids, in which the process

is commonly called *parthenogenesis*; by various internal parasites, as *Distoma* (see cuts under *cercaria*); and strikingly by various hydrozoans. In the last the cycle includes (1) the free-swimming impregnated ovum; (2) the fixation of this ovum to some submerged object and its development into an organism; (3) the formation by such organism of various zooids, as nutritive and generative zooids, unlike each other and unlike the parent, the whole forming a hydroid colony; and (4) the formation by generative zooids of ova, which on being set free complete the cycle. Thus, in a sertularian polyp the ovum is a free-swimming ciliated body, which on fixation develops a mouth and tentacles, and by continued gemination produces two sets of buds, of which the generative set reproduce the free-swimming ciliated ova. In other polyps, as *Corymba*, the set of generative buds themselves become detached as free medusoids like jelly-fish (see cut under *medusoid*), whose eggs develop not into bodies like the parent medusoid, but into the polypide or polypidom of the hydroid colony on which they were produced. In the *Laccariidae* a similar metagenesis occurs by fission. Herbert Spencer adopts Owen's metagenesis as one of three kinds of his agamogenesis, and considers it as (1) *external*, where new individuals bud from unspecialized parts of the parent, and (2) *internal*, as in the case of the transformations of *Distoma*. See *metamorphosis*.

Hence *metall*, *mettle*.] 1. An elementary substance, or one which in the present state of chemical science is undecompos-

able, and which possesses opacity, luster of a peculiar kind (commonly called *metallic*, because very characteristic of the metals), conductivity for heat and electricity, and plasticity, or capability of being drawn, squeezed, or hammered with change of shape but no loss of continuity. Examples of metals possessing all these qualities, although in varying degree, are gold, silver, copper, iron, lead, and tin, all of which have been known from remote antiquity; and on the characters which they possess the idea of a metal was, and mainly still is, founded. These metals also have a high specific gravity, the lightest of them (tin) being over seven times as dense as water. Of the prehistorically known metals, gold, silver, and copper occur more or less abundantly in the native or metallic form, and must have been noticed, and in all probability utilized, in the most remote antiquity, by various nations and over widely extended areas. Iron also occurs native, especially in the form of meteoric iron, and in this way may have first become known and utilized. But iron is now, and has been from time immemorial, smelted from its ores in countries which, from almost every other point of view than the metallurgical, might properly be regarded as uncivilized. The use of iron other than meteoric was not, however, known in the New World before the advent of Europeans. Tin and lead do not occur in the metallic form in nature, unless in very minute quantity; hence, where used, these metals must have been obtained by the metallurgical treatment of their ores. In the case of tin and zinc, as well as of other metals not occurring native, it was not until long after some knowledge had been attained in regard to the practical use of their ores, either by themselves or as ingredients in various alloys, that any accurate idea was obtained of the metals themselves. Thus, brass was certainly made long before anything definite had been learned in regard to the metal zinc, and it is not at all unlikely that the same was the case with bronze and one of its constituents, tin. In addition to the six metals already mentioned, quicksilver was known to the Greeks and Romans in classical times; and this metal also occurs not infrequently in the metallic form, so that its early discovery is not a matter to excite surprise. The anomalous occurrence of quicksilver as a liquid at the ordinary temperature was the reason why neither Pliny nor Isidore nor Geber included it among the metals; nor was it so included by writers on chemistry and metallurgy until after it had been discovered that this fluid could be frozen at a not very low temperature, and that when frozen it was malleable. It was not until the fifteenth and sixteenth centuries that antimony, bismuth, and zinc became known; but their ores had long been in use, although, in the case of the two former metals, only to a very limited extent. The discovery of these metals considerably enlarged the scope of the word *metallic*, since it became necessary to admit that metals could be brittle; this was still further exemplified in the case of the metal arsenic, discovered in 1694 (its oxidized combinations had long been known and utilized), which, although having a metallic luster, is decidedly brittle. This brittleness of substances otherwise metallic in appearance led to their being placed in a class by themselves as "semi-metals," the idea that malleability was a necessary attribute of a metal having come down from the Arabian chemists, and maintaining its hold for many centuries. About the middle and in the latter half of the eighteenth century the number of known metals was greatly increased. In 1741 platina was discovered, but the metals which are always associated with it—osmium, iridium, rhodium, ruthenium, etc.—were not detected until much later. At about the same time as platina, nickel and cobalt were recognized as elements—that is, were first separated and distinguished from their ores, which had been long known and (in the case of cobalt, at least) utilized to a limited extent. Toward the end of the eighteenth century manganese, molybdena, tellurium, uranium, titanium, and chromium became known. About the beginning of the nineteenth century several of the metals of the platina family—palladium, iridium, osmium, rhodium—were separated from the complex alloy known as *native platina*. Up to this time all the known substances to which the name *metal* was applied were much heavier than water, and also decidedly heavier than those considered as non-metallic. Hence, as the old and long-prevailing idea that all metals were malleable had been done away with, a high specific gravity began to be considered as their most important characteristic. Thus we find Cronstedt, who was one of the earliest systematic writers on mineralogy (the first edition of his work was published in 1758), defining metals as "those mineral bodies which with respect to their volume are the heaviest of all hitherto known bodies." With the discovery, by Davy, in 1807, of the metallic nature of the bases of the alkalis a great change took place in this respect, for these substances, metallic from many points of view, especially with reference to their chemical affinities, are lighter than water, and at first, on this account, were by some chemists not admitted to rank as metals. The discovery of the metallic bases of the alkalis was followed by that of the bases of the earths—calcium, barium, and strontium, 1807; zirconium, 1824; aluminium, glucinum, and yttrium, 1828. These metals are all light as compared with the older metals, but heavy in comparison with the metallic bases of the alkalis, the lightest of which—lithium, discovered in 1818—has only a little more than half the specific gravity of water. Cadmium, another heavy metal associated with zinc in its mode of occurrence, and of some importance in the arts, was also separated from its oxid in 1818. Many metals have been discovered within the past few years, all of great interest from the scientific point of view, but no one of them of economical importance, or occurring in sufficient quantity to be utilized to any extent even if possessing valuable properties. So doubtful and difficult are the chemical reactions of some of these elements that their exact number cannot be stated. Several have been worked over by chemists for years without any definite conclusion having been reached; several, after having been accepted for a while, have been dropped from the list. There are about seventy generally recognized elements (see *element*), although some three or four of these may still be considered as more or less doubtful. Of the seventy thirteen are decidedly non-metallic; these

are sulphur, phosphorus, fluorine, chlorine, iodine, bromine, silicon, boron, carbon, nitrogen, hydrogen, oxygen, and selenium; all the other elements are considered to be metals, and selenium was formerly generally so considered, but latterly it has been decidedly included among the non-metals, and the name has been changed by some to *selenion*, to make it correspond with *carbon*, *boron*, and *silicon*, with which elements it is to a certain extent chemically affiliated. Tellurium, on the other hand, although closely related chemically to sulphur and selenium, has always been classed among the metals, chiefly because, although brittle, it has a decided metallic luster. The names of the metals, so far as is possible, all end in *-um*; even platinum is frequently written *platinum*. A division of the elements into metals and non-metals is recognized by chemists at the present time as being rather a matter of convenience from the popular point of view than as one capable of exact scientific definition. The words *metalline* and *metal*, however, cannot be dispensed with in common life and the arts, and their use can very rarely lead to any confusion. The exceptions to this general statement that the metals have a "metallic" luster, and that the non-metals do not, are, on the whole, extremely insignificant. Only in the case of selenium and phosphorus in certain of their allotropic forms could there be any question as to whether the term *metallic luster* could properly be used with reference to a non-metal.

**Aich metal**, or **Aich's metal**, an alloy of about two parts of zinc with three of copper, to which about two per cent. of iron is added. This alloy is very malleable at a red heat, and can be hammered, rolled, or drawn into finewire. It has been used in Austria for cannon, and is believed to have been known to the Chinese.—**Antifriktion metals**. See *antifriktion*.—**Babbitt metal**. [Named from Isaac Babbitt, the inventor (1779-1823).] An alloy of tin with copper and antimony, used for bearings, bushings, or pillow-blocks. This alloy consists of 83 per cent. of tin, the remaining 17 per cent. being made up of the two other metals. Sometimes called *babbitting*.—**Base metals**, in *metal.*, the metals not classed as noble, especially lead, zinc, copper, and iron.—**Bath metal**. [Named from *Bath*, England.] A white brass consisting of 55 parts of copper and 45 of zinc. The name is also given to other combinations of the same metals.—**Blue metal**. (a) A well-sinker's name for blue clay. (b) See *blue*.—**Bowl-metal**, a name given to antimony in the second stage of the English smelting process of that metal. **Britannia metal**, an alloy containing tin, antimony, and copper, to which bismuth, zinc, and lead are occasionally added. The essential metal is tin, which usually constitutes nine tenths or more of the mass, the antimony and copper being added to give the desired hardness. This alloy is extensively used for table-ware, being usually, for that purpose, covered with a thin coating of silver, and sold as silver-plate. In the best plated ware, however, the silver is laid on a body of German silver.—**Coarse metal**, the technical name of the product of the second operation in the process of smelting mixed cupriferos ores in Great Britain, especially at Swansea. The product of this operation, which is performed in a reverberatory furnace, is a matte or regulus containing iron and copper in combination with sulphur in about the same proportion in which they are present in copper pyrites, together with slag.—**Composition metal**. See *composition*.—**Dutch metal**. See *Dutch*.—**Fusible metal**, a metallic alloy that fuses at a very low temperature. Such alloys are usually composed of lead, tin, and bismuth. Among those best known are—Newton's metal, containing 3 parts of bismuth, 5 of lead,

and 3 of tin, which fuses at 202°; Rose's metal, 2 parts of bismuth, 1 each of tin and lead, fusing at 201°; and an alloy of 5 parts of bismuth, 3 of lead, and 2 of tin, fusing at 197°. The addition of cadmium to alloys of bismuth, tin, and lead lowers their fusing point considerably. Thus, if from 8 to 10 per cent. of cadmium is added to Rose's metal, the melting-point is reduced to 167°. The alloys known as Wood's and Wood and Lipinsky's metals are such alloys of cadmium, bismuth, tin, and lead. One of these, containing cadmium, 1 part, and tin, lead, and bismuth each 5 parts, melts at 150°. The addition of mercury to fusible alloys like Newton's and Rose's metals is said also to lower their fusing-point considerably.—**Gathered metal**. See *laden metal*, under *laden*.—**Gedgess's metal**. Same as *Aich metal*.—**Heavy metal**. See *heavy*.—**Kier's metal**, a gun-metal composed of 100 parts of copper, 75 of zinc, and 10 of iron.—**Laded metal**. See *laden*.—**Light metal**, any metal of which the specific gravity is less than 5.—**Magnetic metals**, iron, nickel, cobalt, chromium, and manganese.—**Muntz's metal**. [Named from Mr. Muntz of Birmingham, the inventor.] Yellow metal; an alloy of 3 parts of copper and 2 of zinc, differing from common brass in being malleable when hot. It is cheaper and can be more easily rolled than copper, and has taken its place as the material used for sheathing, formerly one of the most important uses to which copper was put. *Yellow metal* is its general commercial name. Also called *patent metal*.—**Newton's metal**. See *fusible metal*, above.—**Noble or perfect metals**, gold, silver, and platinum; so called because when exposed to the air they do not oxidize like other metals, but retain their metallic luster.—**Organ- or pipe-metal**, an alloy of tin and lead, with or without zinc, used for the construction of organ pipes. The value of the metal depends principally upon the proportion of tin used, less than 50 per cent. making poor metal. The product of the fourth operation is variously designated as *blue*, *white*, or *pimple-metal*, according to the percentage of copper contained and the peculiar appearance exhibited. Portions having a smooth lustrous fracture, and containing from 60 to 70 per cent. of copper, are designated as *blue metal*; those of grayish white color, with granular fracture, and containing from 75 to 78 per cent. of copper, are called *white metal*. *Pimple-metal* is that which contains more than 75 per cent. of copper, and has its surface pimpled from the escape of sulphurous acid gas.—**Wood's metal**. II. *n.* In *chem.*, a term which has been variously applied; as, (a) to the metallic bases of the fixed alkalis and alkaline earths, probably in consequence of their low specific gravity; and (b) to all the non-metallic elementary substances. In the latter sense it is now used by chemists. The metalloids are thirteen in number: oxygen, hydrogen, nitrogen, carbon, chlorine, bromine, iodine, fluorine, sulphur, selenium, phosphorus, boron, and silicon. The distinction between a metal and a metalloid is, however, purely artificial, being based on physical rather than chemical criteria; but, broadly, a metal may be said to differ from a metalloid in being an excellent conductor of heat and electricity, in reflecting light more or less powerfully, and in being electropositive. Though a metalloid may possess one or more of these characters, it will not be

found to unite them all. Berzelius, in his classification, restricts the term *metalloid* to the inflammable non-metallic elements—sulphur, phosphorus, carbon, and boron. See *element*, 3, and *metal*, 1.

First formulated as a system by Burg in 1848, and hence often called *Burgism*, it has been recently revived by Charcot. Simple disks of various metals are employed in contact with the external parts of the body, from which different therapeutic results are claimed. Other observers assert that all the phenomena described as following the application of metals may be produced by disks of wood, and that whatever curative results are attained are due to mental effects, rather than to any special virtues emanating from the metals themselves.

**metallurgical** (met-a-lēr'jik), *a.* [= F. *métallurgique* = Sp. *metallúrgico* = Pg. *metallúrgico*; < NL. *metallurgicus*; < *metallurgia*, metallurgy; see *metallurgy*.] Pertaining to metallurgy, or the art of working metals.—**Metallurgical chemistry**, that part of chemistry which teaches the combinations and analyses of metals.

It. *metallurgia*; < NL. *metallurgia*; < Gr. *μεταλλουργία*, working metals, a miner, < *μεταλλικός*, a mine (metal), + *εργον*, work.] The science of smelting. In smelting, the metals are separated by known methods from the mineralizing substances with which, with few exceptions, they naturally occur combined. Thus, the common ore of lead is galena, a combination of sulphur with that metal. The smelter treats this combination in the furnace, and the result is metallic lead. The treatment of some ores is simple and easy; that of others is difficult and complex. Smelting implies the use of fire, or separation of the metal in the dry way, but processes carried on in the humid way are not unfrequently employed in the treatment of metalliferous ores. This is not ordinarily called smelting, but metallurgical treatment. The ores of many mining regions are treated at or near the place where they are mined, but it is not at all uncommon for ores to be carried to a great distance to be smelted. Thus, until within a few years, a large part of the copper used in the world was smelted at Swansea, in Wales, from ores brought from various countries, metallurgical skill and the command of cheap fuel making it desirable to have the ore treated there rather than at the place where it was mined. Abbreviated *metall*.

See *metameric*, *metamerism*. The construction of bilaterally symmetrical bodies by metamerism is common and usual in the animal kingdom, and is exhibited in such diversity of details that metameres have received several different names. The most general name is *segment*; but, since several morphologically distinct metameres may coalesce in one segment, the stricter term for an individual metamere, such as each morphological segment or ring of an annelid, crustacean, insect, or other articulate animal, is *somite* or *arthronome*. A morphological metamere of a vertebrate has been called a *diarthronome*. Compare *actinomere* and *antimer*.—**Ambulacral metameres**. See *ambulacra*.

**metameric** (met-a-mēr'ik), *a.* [As *metamere* + *-ic*.] 1. In *chem.*, pertaining to or characterized by metamerism.—2. Thus, aldehyde and ethylene oxide have their elements in the same proportion, C<sub>2</sub>H<sub>4</sub>O, and the same molecular weight, 44, but are very different in their chemical properties. Two metameric bodies do not, however, belong to the same class or series of compounds. See *isomerism*, *polymerism*.

**metameron** (me-tam'er-on), *n.*; pl. *metamera* (-rē). [NL.; see *metamere*.] Same as *metamere*.

**metamorphic** (met-a-mōr'fik), *a.* [= F. *métamorphique*; as Gr. *μετά*, among (denoting interchange), + *μορφή*, form, + *-ic*. Cf. *metamorphosis*.] 1. Producing metamorphosis; changing the form or structure; transforming; as, a *metamorphic* cause or agency; *metamorphic* action.—2. Exhibiting metamorphosis or metamorphism; changed in form or structure; metamorphosed.—**Metamorphic rocks**, in *geol.* See *metamorphism*.

**metamorphism** (met-a-mōr'fiz-m), *n.* [As *metamorphic* + *-ism*.] The process of metamor-

phosing, or changing the form or structure; specifically, chemical change and rearrangement of the constituents of a rock by which they are made to assume new forms and enter into new combinations, the most important result of these changes being that the rock becomes harder and more crystalline in structure. Thus, the metamorphic slates are crystalline schists. The sedimentary rocks, especially those made up of the debris of feldspathic minerals, are those most liable to undergo metamorphism; hence it is that the argillaceous rocks offer the most conspicuous examples of this process, and it is these which are most altered in external characters by it, foliation and slaty cleavage being often highly developed in the process. Volcanic rocks also are subject to metamorphic changes, although the results are usually much less conspicuous to the eye unaided by a microscope than in the case of the sedimentary deposits. Examples of metamorphism are the conversion of ordinary earthy limestone into crystalline marble, of argillaceous shales into various kinds of schists (mica-schist, talc-schist, etc.), and of sandstone into quartzite. Closely connected with the phenomena of metamorphism is the development in a rock of a slaty cleavage or of a foliated structure. Metamorphic agencies and the results which they have brought about have been much studied of late years by geologists, and the modern methods of lithological research have been most important aids in this direction. The most obvious and generally accepted classification of metamorphic action is into "contact" and "regional" metamorphism. In the case of contact metamorphism the changes observed are apparently due—in large part, at least—to the presence of an adjacent mass of rock, usually of an intrusive character, as when the strata are seen to have been altered along the walls of a dike. In the case of regional metamorphism, when large masses of rock are found to have been affected and rendered crystalline without any special cause being visible in the form of adjacent intrusive or igneous material, the phenomena are more difficult of explanation than in the case of contact metamorphism. In the course of the numerous discussions of this subject a great number of new terms have been introduced, the meaning of which is, owing to the complexity of the phenomena and the imperfection of the observations, often rather obscure; some of these terms may here be cited. Assynonyms of "regional" metamorphism, the epithets "normal" and "general" have been used by some authors, while others have indicated a desire to specialize in their application. Thus, Prestwich limits "normal metamorphism" to the changes due to central heat, and "regional metamorphism" to changes effected by the heat produced locally within the crust of the earth by transformation into heat of the mechanical work of compression or of crushing of parts of the earth. Bonney desires to reserve the phrase "regional metamorphism" for those ancient rocks occupying extensive areas of the earth's surface "which, whatever be their history, are in all probability by no means in their original condition." Dana prefers "local" to "contact," but does not use the two exactly as synonyms, since he makes local "include changes due to heated emanations and other conditions where there are no contacts"—in other words, he uses "local" rather as the opposite of "general," ignoring the idea embodied in the term "contact," namely that a visible cause of the observed metamorphism is present in the form of an adjacent mass of intrusive or heterogeneous rock. Kinahan proposes "metapepsis" and "paropthesis" as the synonyms of regional and contact metamorphism. "Why we need to go to the Greek for [the] two words is not clear." (Dana.) Many geologists are of the opinion that the movements which the rocks composing the earth's crust have undergone in certain regions, which movements must necessarily have been accompanied by pressure, stress, shearing, or "flow," have been among the most important causes of metamorphic change. The most comprehensive term by which metamorphism originating in conditions of this kind has been designated is that introduced by Rosenbusch, "dynamical." Other writers on this subject have used as following nearly or quite synonymous with "dynamical" the following: "pressure," "compression," "mechanical," "friction," "dislocation." Judd has introduced the term "statical metamorphism" as indicating changes which may have taken place in deep-seated rocks quite independently of any movement to which they have been subjected. As designating and discriminating between various kinds of metamorphic changes, with special reference to the character of the results produced, Dana has introduced the terms "crystalline," "paramorphic," and "metachemic." The first of these implies a simple development of a crystalline condition in the original material, such, for instance, as takes place in the conversion of limestone into marble ("marmarosis" of Gekkie); the second, a change from one paramorphic state to another, as from argillite to hornblende; the third, a change through chemical transformations, as of chrysotile to serpentine. "Metasomatic metamorphism" (or, in one word, "metasomatosis") and "methylosis" are terms which have been suggested in this connection, but which have met with little favor; they were apparently intended by their authors to include chemical changes similar to those which take place in the formation of pseudomorphs, and are allied to the "metachemic" of Dana. "Metastasis" and "metacrisis" are terms which have been coined, but have not become current—the one to denote changes somewhat similar to those included by Dana under "crystalline," the other (as defined by that author) to "denote changes like the conversion of a mass of mud into a mass of quartz with mica and other silicates."

the time it ceases to be an embryo to the time it ceases to live as a bodily organism. Metamorphology and embryology together constitute ontogeny.

The pictures are drawn or painted on a series of bands of muslin or paper, each having independent motion on rollers in a box, and each of a different length from the others. The bands are arranged with their edges as near together as possible, and the figures are painted across the entire series. The motion of the bands is made constantly to displace the parts of the different figures and recombine them in ludicrous fashion at a slot in the cover of the box.

*Pownall, On Antiquities*, p. 69. (*Latham*.)

**metamorphosis** (met-a-môr'fô-sis), *n.*: pl. *metamorphoses* (-séz). [Formerly also *metamorphose*, *q. v.*; *L. metamorphosis*, *Gr. μεταμορφωσις*, a transformation, *μεταμορφωσθαι*, he transformed, *μετα*, over, + *μορφή*, form, shape.] 1. Change of form or structure; transmutation or transformation. Used most frequently in literature with reference to the old or poetic conception of a miraculous transmutation of a person, animal, or thing into a different and often antagonistic or contrasting form, either with or without a corresponding change of nature.

With Severne she along doth go,

Her Metamorphosis to show.

*Drayton, Polyolbion*, vi., Arg.

3. In *chem.*, that chemical action by which a given compound is caused, by the presence of a peculiar substance, to resolve itself into two or more compounds, as sugar, by the presence of yeast, into alcohol and carbonic acid.—4. In *bot.*, the various changes that are brought

about in plant-organs, whereby they appear under changed or modified conditions, as when stamens are metamorphosed into petals, or stipules into leaves. Metamorphosis does not imply that the petal, for example, has ever been a stamen, but it implies an alteration in the organizing force, which took effect at a very early period in the life of the organ, at or before the time when the primitive aggregation of cells became differentiated into the several parts of which it is normally composed. It is due merely to the fact that the development of the organ has pursued a different course from what is usual. The various kinds of metamorphoses are described under the names of *chlorosis*, *ptilodis*, *phyllody*, *pistillody*, *sepalody*, *stamindody*, etc. (which see). — *Coarctate metamorphosis*. See *coarctate*. — *Complete metamorphosis*. See *holometaboly* and *complete*. — *Imperfect or incomplete metamorphosis*. See *hemimetaboly* and *imperfect*. — *Metamorphosis of organs*, in *bot.*, the progressive adaptation of one organ to several different purposes, connected with which are changes in size, color, and other particulars. Thus, all the parts of a plant are reducible to the axis and its appendages, the other parts developing themselves from these. See *morphology*. — *Progressive metamorphosis*, transformation from a lower or more simple to a higher or more complex substance; anabolism. — *Retrospective metamorphosis*, transformation from a higher or more complex to a lower or more simple substance; catabolism. Oftener called *retrograde metamorphosis*. = *Syn.* 1. See *transform*, *v. t.*

**Metamorphic system**, in *entom.*, a scheme of classification first proposed by Swammerdam, based on the characters of the metamorphoses and the condition of the larva and pupa, whether resembling the adult or differing from it more or less widely. This scheme, improved by subsequent authors and combined with characters drawn from the study of perfect insects, is the basis of the best modern systems of entomological classification.

When there are fewer than five, it is always the lateral metatarsals which have disappeared, so that an animal with three metatarsals has lost the first and fifth; in one with a single metatarsal the third or middle one remains. Metatarsals may ankylose together, as two do in the metatarsus of the ox, and three in that of any recent bird: in the latter case the compound bone is further complicated by fusion with it of tarsal elements, constituting a tarsometatarsus (which see). See cut at *metatarsus*.—**Accessory metatarsal**, in *ornith.* See *metatarsus*, 1.

The middle segment of the three of which the foot, or third division of the hind limb, consists, considered with special reference to its bony structure. It is the part of the foot between the tarsus and the toes, in man corresponding closely with the instep, and composed of five bones. (See cut under *foot*.) In a horse it is the part of the hind leg between the hock and the fetlock, and has but one functional bone. In birds it is the part popularly called the *shank*, and in descriptive ornithology known as the *tarsus*. In most birds the metatarsus is naked and scaly, and extends from the bases of the toes to the surrator or first joint above. It usually consists of a single stout bone, representing three metatarsals fused together, and further complicated by the fusion of distal tarsal elements with its proximal end. In birds with four toes the metatarsus includes a small separate bone known as the *accessory metatarsal*, which is the metatarsal bone of the hallux or hind toe, the metatarsus hallucis.

Front of Left Tarsus (Tarsometatarsus) of Penguin (*Aptenodytes longirostris*), natural size. *a*, articular facet for outer condyle of tibia; *b*, articular facet for inner condyle of tibia; *c*, *c*, two foramina, showing incomplete fusion of three metatarsals; *d*, point of attachment of accessory metatarsal; *e*, *e*, articular facets for second, third, and fourth toes.

2. In *entom.*: (*a*) The first one of the joints of the tarsus, when it is large or otherwise distinguished from the rest, which are then called collectively the *clavus*. Also called *planta*, in which case the other joints are collectively known as the *digitus*. The peculiarly expanded and bristly metatarsus or planta of bees is known as the *scopula*. (*b*) With some authors, the hind foot; the entire tarsus of each hind leg; each of the third pair of tarsi. When this nomenclature is used, the tarsus of the middle leg is called *mesotarsus* and that of the fore leg *protarsus*. The marsupials are the only known examples, the term being thus equivalent to *Didelphia*. It is correlated with *Prototheria* and *Eutheria*.

*D. M. Wallace*, *Russia*, p. 519.

**metayer** (me-tā'yōr; *F.* pron. mā-tā-yā'), *n.* [*< F. metayer*, *< ML. medietarius*, one who tills land for half the produce, *< L. medietas* (-tēs), middle place, half; see *moiety*, *mediety*.] A cultivator who tills a farm or piece of ground for the owner, on condition of receiving a share of the produce, generally a half, the owner generally furnishing the whole or a part of the stock, tools, etc. This system of cultivation, called *metayage* or the *metayer system*, prevails in the central and southern parts of France and in most of Italy, and is practised to a considerable extent in the southern United States.

The principle of the *metayer* system is that the labourer or peasant makes his engagement directly with the landowner, and pays, not a fixed rent, either in money or in kind, but a certain proportion of the produce, or rather of what remains of the produce after deducting what is considered necessary to keep up the stock. The proportion is usually, as the name imports, one-half; but in several districts in Italy it is two-thirds. Respecting the supply of stock, the custom varies from place to place; in some places the landlord furnishes the whole, in others half, in others some particular part, as for instance the cattle and seed, the labourer providing the implements.

*J. S. Mill*, *Pol. Econ.*, II. viii. § 1.

The *metayer* has less motive to exertion than the peasant proprietor, since only half the fruits of his industry, instead of the whole, are his own.

*J. S. Mill*, *Pol. Econ.*, II. viii. § 2.

**metaynt**, *n.* A Middle English form of *mitten*. **Metazoa** (met-ā-zō'ā), *n. pl.* [*NL.*, pl. of *metazoön*, *q. v.*] All those animals which are above the *Protozoa*, and which in the course of their development undergo certain metamorphoses, consisting of the primary segmentation of a true egg or ovum, and the subsequent passage through an embryonic condition in which they possess at least two distinct germinal layers; animals exhibiting cellular differentiation. The *Metazoa* are distinguished from the *Protozoa* in that the substance of the body is differentiated into histogenic elements—that is to say, into cells. In all the *Metazoa* the ovum has the form of a nucleated cell, the first step in the process of development being the production of a blastoderm by the subdivision of that cell, the cells of the blastoderm giving rise in turn to two layers of cells, endoderm and ectoderm, between which, in most cases, a mesoderm appears, to be itself split in two layers; such a four-layered germ developing finally all the histological elements of the adult body. With the exception of certain parasites, and the extremely modified males of a few species, all these animals possess a permanent alimentary cavity lined by a special layer of endodermal cells. Sexual reproduction is the rule, and very generally the male element has the form of filiform spermatozoa. The lowest term in the series of the *Metazoa* is represented by the *Porifera* or sponges. Those of the *Metazoa* which possess a notochord, and in the adult state have the trunk divided into segments or myotomes, constitute the subkingdom *Vertebrata*; the rest are the several subkingdoms of invertebrates. Compare *Protozoa*. See *Mesozoa*, and cuts under *gastrulation*.

**meteorite** (mē-tē-ōr'it), *n.* [*< meteor + -ite.*] A mineral or metallic mass of extraterrestrial origin, or which, to use the common expression, has "fallen from the heavens." Bodies of this kind were formerly often called *aerolites*, but *meteorite* is now their generally accepted name among scientific men. The fall of meteorites upon the earth is a by no means infrequent occurrence, and records of such events date back to many centuries before the present era. Traditions point to the very early use of meteoric iron for the manufacture of weapons; and it is also known that meteorites were not infrequently the objects of worship in various parts of the world. In spite of this, the fall of rocks or metals from the heavens seemed to be so improbable an event that full credence was not given by scientific men to stories of such occurrences until about the beginning of the present century, when, several falls having taken place (at Barbotan, France, 1790; Siena, 1794; Wald Cottage, Yorkshire, Eng., 1795; Saïes, France, 1798; Benares, 1798; L'Aigle, France, 1803), the details of some of which were thoroughly investigated, a further denial of their genuineness became impossible. From the time of the fall at L'Aigle all doubt in the matter was abandoned. There are now several collections of meteorites, each of which contains specimens of between 300 and 400 different falls, and the whole number known is not far from 400, although it is by no means the case with all these occurrences that the specimens were seen to fall; many of them have been found on the earth's surface, but have been recognized as being extraterrestrial by their peculiar appearance and composition. The most important facts with regard to meteorites may be concisely stated as follows: They have not been found to contain any element not known to occur on the earth; they have furnished no evidence of the existence of life on the body or bodies of which they originally formed a part; they bear no indications of having been formed in the presence of water, or of the existence of water beyond the earth's atmosphere in the regions from which they came; they do exhibit abundant evidence of having had what geologists would call an "igneous origin"; they are never granitic in character, but resemble very closely certain volcanic rocks of not infrequent occurrence, with this difference, that in the case of the meteorites the iron associated with the silicated combinations exists in the metallic form, while in the terrestrial volcanic rocks it is, with rare exceptions, oxidized. Furthermore, meteorites, almost without exception, show a certain family resemblance; so that it is necessary to admit, either that they all originally formed a part of one celestial body, or else that, having come from various members of the solar system, or from other systems, these have a wonderful resemblance to each other and to the earth itself. The most obvious division of meteorites is into *metallic* and *stony*, but the passage from one class to the other is by no means abrupt one. All metallic meteorites agree in that the predominating metal is iron, with which nickel is almost invariably associated; indeed, it has not been proved that there is any meteoric iron entirely free from that metal. With the nickel cobalt is almost always found, as is the case in terrestrial combinations. Tin and copper are also frequently found in meteorites in small quantity. The precious metals have not been detected in them. Meteorites composed almost entirely of metallic (nickeliferous) iron, forming a nearly homogeneous mass, have been denominated *siderolites*. These, however, almost always contain irregular nodular masses of pyrrhotite, schreibersite (phosphuret of iron and nickel, either one or both, and occasionally of graphite. In a large proportion of the meteoric irons, etching the polished surface with an acid develops the so-called "Widmannstätt figures." The development of these figures on the polished surface of a mass of iron found upon the earth's surface, and in regard to the time of whose fall nothing was known, was formerly considered to be sufficient evidence of the celestial origin of such a mass, especially if, in addition, the presence of nickel could be shown by chemical analysis. While most of the metallic masses thus referred have almost certainly been correctly classed among the meteorites, there may be cases in which such reference has not been justifiable, since it is now known that all celestial irons do not give the Widmannstätt figures, while the iron found in large quantity and over a wide area, associated with and embedded in basalt, near Övifak in Greenland, contains nickel, and gives, when etched, figures which have generally been considered as Widmannstätt figures, although others have denied that they could properly be so denominated. The terrestrial origin of the Övifak iron is, however, now generally

Meteoric Iron.

admitted, although for a considerable time after its discovery this was not the case. The wide extent of the area over which this iron occurs, and its peculiar intimate association with the minerals of which the basalt is made up, led the idea that the metal could have fallen from above into lava in process of eruption, which was at first the favorite theory of its origin. Next in order to the siderolites come the *pallasites*, so named from the fact that a large meteorite of this class was in 1772 discovered in Siberia by the distinguished traveler Pallas. Under the name of *pallasites* are comprehended those meteorites which consist of a spongy or vesicular mass of iron, the cavities of which are in most cases partly or entirely filled with olivine, with which various other minerals are frequently associated, enstatite and bronzite being the most common, while chromite is of not infrequent occurrence. Both siderolites and pallasites belong to the class of metallic meteorites. By far the larger part of the stony meteorites are included under the designation of *chondrites*. In these the iron is distributed in fine particles through a more or less intimate mixture of silicates, with which chromite and magnetic pyrites are frequently associated, the silicates being chiefly olivine and bronzite. The name *chondrite* has reference to the fact that in this class of meteorites the material of which they are composed occurs in the form of rounded grains (chondria). The chondritic meteorites have, however, a quite varied structure, in some few cases passing into a breccia; they have been divided into numerous subgroups in accordance with these structural variations. Most of the stony meteorites

contain iron disseminated through their mass in grains or nodules; but there are a few which are destitute of such metallic particles. There are also a few stony meteorites which do not exhibit any traces of a chondritic structure; the minerals of which these are made up do not, however, differ very essentially from those occurring in the chondrites. There are also a few very anomalous meteorites which contain carbonaceous matter associated with the stony chondritic material. This carbon is not graphitic, but is combined with hydrogen and oxygen, the product resembling to a certain extent that resulting from the decay of organic matter, but no traces of vegetable tissue have been discovered in these carbonaceous meteorites, which are only five or six in number. One or two interesting facts remain to be mentioned. The first is that since the phenomena of meteorites began to be observed and studied there have been extremely few falls of metallic meteorites. Of all the meteoric irons in the various collections, those of Hraschina in Austria (1751), of Dickson county, Tennessee (1855), of Brannau in Bohemia (1847), and a few others (in all probably about nine), are the only ones positively known to have fallen; all the others are considered meteoric on account of their peculiar appearance and chemical composition. The observed falls of stony meteorites, on the other hand, are numerous. Another remarkable fact is that all the meteorites which are known to have fallen are of infinitesimally small size as compared with the earth. In the fall of L'Aigle some 2,000 to 3,000 stones were estimated to have reached the earth, and of these the largest weighed only seven or eight pounds. The largest meteorites of which the fall was observed are that of Ensisheim (1492), which weighed about 280 pounds, that of Juvinas (1821), 242 pounds, and that of Emmett county, Iowa (1879), when a considerable number of stones fell, the largest of them weighing 437 pounds. Some masses of iron believed to be meteorites, the date of whose fall is unknown, are much larger than this, but still utterly insignificant in size, not only as compared with the earth or its satellite, but even with the smallest celestial body of which anything is definitely known, namely the outer satellite of Mars, which has been estimated at from five to twenty miles in diameter. The mass of iron on the river Bendegó in Brazil has been variously estimated at from seven to ten tons in weight; that of Tucuman (Campo del Cielo) is said to weigh fifteen tons. The Santa Caterina iron appears to be still larger, having been estimated at twenty-five tons; but doubts have been expressed as to whether this is really of celestial origin.—*Neumann's lines*, structural lines described by J. G. Neumann as occurring in the Brannau meteorite.

(a) Rhythm in language; rhythmic language as measurable by prosodic times or uttered syllables; more specifically, arrangement of language in a succession of rhythmic movements, readily appreciable as such by the ear; verse, as opposed to prose. Meter in this sense is the subject-matter of the science of metrics. (b) Measured verse or rhythmic language; rhythmic language as determined by or divided into fixed measures. (1) A measure, foot, or dipody. See *measure*. [Rare.] (2) A line, verse, or period in ancient metrics; specifically, a monosyllabic verse or a dactylic or trochaic period, as opposed to a hypermeter. Meters are called *monometers*, *dimeters*, *trimeters*, etc., according to the number of measures in a verse, also *acatalectic*, *catalectic*, *brachycatalectic*, etc., *meters*, according to the completeness or incompleteness of the feet or measures. (3) A kind of verse; a particular variety of poetic rhythm, as expressed by the kind of feet of which the verse consists; as, iambic, dactylic, Ionic *meter*; a particular form of metrical composition; as, *Alcaic meter*, *elegiac meter*. In ancient metrics meters were called *monoid*, *pure*, or *simple meters* when they consisted of one kind of foot throughout, *compound* or *episynthetic meters* when composed of cola of different kinds of feet, *mixed meters* when uniting different kinds of feet within the same colon.

2. In *music*, the division of a composition into parts of equal time-value and of similar essential rhythmic structure. The smallest part thus indicated is that between successive primary accents, and is called a *measure*; in printed music this is marked by a bar before each primary accent. But meter includes also, in a general way, the division of a piece into equal and similar parts of more than one measure, such parts being called *phrases* or *strophes*. In this sense musical meter has obvious analogies with meter in verse, though the analogies cannot always be pressed with safety, especially as the nomenclature is not strictly parallel. (See *metres*<sup>2</sup>, 2.) *Rhythm* may be distinguished from *meter* in that it deals primarily with the accents and the typical and actual accentual patterns, which meter gathers into groups and sections in accordance with their time-value. This distinction, however, is not always observed or even acknowledged. Sometimes the meaning of the term is reversed, rhythm being made a matter of time, and meter one of accent. Sometimes, too, the two terms are made entirely interchangeable.

3. In *Eng. hymnology*, a pattern of versification, including the structure of the prosodial feet used, the grouping of those feet into lines, and the grouping of lines into stanzas or strophes, popularly called *verses*. See *foot* and *versification*. According to the kind of feet used, meters are usually either iambic, trochaic, or dactylic. The principal *iambic meters* are: *Common Meter* (C. M.), having alternately eight and six syllables to the line; *Long Meter* (L. M.), having eight syllables to the line; and *Short Meter* (S. M.), having two lines of six syllables, followed by one of eight, and then by another of six. Each of these meters has properly four lines to the stanza, so that their syllabic scheme is as follows: C. M., 8, 6, 8, 6; L. M., 8, 8, 8, 8; S. M., 6, 6, 8, 6. Each of them may also be doubled, so as to make eight-lined stanzas, the meter then being called *Common Meter Double* (C. M. D.), *Long Meter Double* (L. M. D.), or *Short Meter Double* (S. M. D.). *Long meter* may also have six lines to the stanza, and is then called *Long Meter, Six Lines*, or *Long Particular Meter* (L. P. M.), with the syllabic scheme 8, 8, 8, 8, 8, 8. Other meters of this class are *Common Particular Meter* (C. P. M.), 8, 8, 8, 8, 6, 8; *Short Particular Meter* (S. P. M.), 6, 6, 8, 6, 6, 8; *Hallelujah Me-*

*ter* (H. M.), 6, 6, 6, 6, 8, 8; *Star* (S.), 6, 6, 6, 4, 4, 4, 4; *Serens and Sizes*, 7, 6, 7, 6; *Tens*, 10, 10, 10, 10; etc. The principal *trochaic meters* are *Serens*, 7, 7, 7, 7; *Elbows and Serens*, 7, 8, 7; *Sizes*, 6, 6, 6, 6; *Sizes and Sizes*, 6, 5, 6, 5; etc. The principal *dactylic meters* are *Elbows*, 11, 11, 11, 11; *Elbows and Tens*, 11, 10, 11, 10; etc. Numerous modifications of these schemes occur, especially in recent hymns. **Accental meters**. The meter is equal to 39.3707 inches according to Professor Rogers, and to 39.37085 inches according to General Comstock. The chambers are of known capacity, and the revolutions of the wheel are recorded on dials. At the recent meeting of the British Association, Dr. E. B. Tylor read an interesting paper on the laws of marriage and descent, illustrative of his ingenious method of studying ethnological phenomena. All myths and customs, on a close study, may by analysis be disintegrated, and are found to consist of certain elements. Dr. Tylor arranges these elements statistically, and, by inquiring which occur simultaneously among various peoples, proves that certain groups of such elements belong genetically together. This he calls the *method of adhesions*.

Its members place especial emphasis upon the doctrines of entire sanctification and eternal punishment. They rigidly enforce the rule for simplicity of dress, and prohibit the use of choir or musical instrument in church service; they have abandoned episcopacy, and have one superintendent elected every four years.

**II. a.** Of or pertaining to Methodism or the Methodists; belonging to or agreeing with the general body of Methodists: as, *Methodist principles*; a *Methodist church*.—**The Methodist Church**, a Christian body existing in several distinct church organizations, the most important of which are that known in England as the *Wesleyan* and that known in the United States as the *Methodist Episcopal Church*. These two bodies do not differ materially in doctrine, worship, or ecclesiastical organization. They are evangelical, and Arminian in theology. Their worship is generally non-liturgical. Each Methodist society, or local church, is organized in classes, under class-leaders; the different societies, which are sometimes grouped in circuits, are combined in districts, each of which is, in the United States, under the superintendence of a presiding elder. The American churches also have bishops, who are not diocesan, but itinerant, possessing concurrent jurisdiction over the whole church. The highest ecclesiastical court is the General Conference, which meets every fourth year. In the United States lay delegates have been admitted to the Conference since 1872, and in England since 1880, before which dates the Conference was a purely clerical body. Other Methodist churches are: The *Welsh Calvinistic Methodists*, Calvinistic in theology, formed from the *Countess of Huntingdon's Connection*, which is Congregational in polity; the *Methodist New Connection*, which gives a larger degree of power to the laity than does the Old Connection; the *Bible Christians*; the *Primitive Methodists*; the *United Methodist Free Churches*, a combination of three pre-existing Methodist organizations; and the *Wesleyan Reform Union*. All the above are British organizations. In the United States, the Methodist Episcopal Church exists in two geographical divisions, the *Methodist Episcopal Church (North)*, and the *Methodist Episcopal Church (South)*. There is also an *African Methodist Episcopal Church*, an *African Methodist Episcopal Zion Church*, the *Colored Methodist Episcopal Church in America*, the *Union American Methodist Episcopal Church*—all composed entirely of colored Methodists; the *Evangelical Association*, popularly though inaccurately termed *German Methodists*, or *Albrights*, from the name of their founder; the *United Brethren in Christ*, which is essentially though not nominally a Methodist body; the *Methodist Protestant Church*, which rejects episcopacy; and the *Wesleyan Methodist Connection of America*. In Canada several of the Methodist bodies have been consolidated into a single organization, called the *Methodist Church of Canada*. All these Methodist bodies agree in having a consolidated ministry for each body, each minister being subject to change of parish within certain definite periods. This feature of their economy is called "the itinerancy."

First adopted in France (definitely in 1790), it is in general use in most other civilized countries, except the English-speaking countries, and is now almost universally adopted for scientific measurements. Its use is permitted in Great Britain, and was legalized in the United States in 1866. The meter, the unit of length, was intended to be one ten-millionth part of the earth's meridian quadrant, and is so very nearly. Its length is 39,370 inches. (See *meter*<sup>3</sup>.) The unit of surface is the *are*, which is 100 square meters. The theoretical unit of volume is the *stere*, which is a cubic meter. The unit of volume for the purposes of the market is the *liter*, which is the volume of 1 kilogram of distilled water at its maximum density, and is therefore intended to be 1 cubic decimeter. For 10 times, 100 times, 1,000 times, and 10,000 times one of the above units, the prefixes *deca-*, *hecto-*, *kilo-*, and *myria-* are used. For  $\frac{1}{10}$ ,  $\frac{1}{100}$ ,  $\frac{1}{1,000}$  of the respective units, *deci-*, *centi-*, and *milli-* are prefixed. The micron, adopted by the international commission, is one millionth of a meter. The following is a complete table of equivalents:

1 myriameter	= 5.4 nautical miles, or 6.21 statute miles.
1 kilometer	= 0.621 statute mile, or nearly $\frac{1}{2}$ mile.
1 hectometer	= 109.4 yards.
1 decameter	= 0.497 chain, or 1.988 rods.
1 meter	= 39.37 inches, or nearly 3 feet 3 inches.
1 decimeter	= 3.937 inches.
1 centimeter	= 0.3937 inch.
1 millimeter	= 0.03937 inch, or 1-25.4 inch.
1 micron	= $\frac{1}{10,000}$ inch.
1 hectare	= 2.471 acres.
1 are	= 119.6 square yards.
1 centiare (or square meter)	= 10.764 square feet.
1 decastere	= 13 cubic yards, or about 2½ cords.
1 stère (or cubic meter)	= 1.357 cubic yards, or 35.3 cubic feet.
1 decistère	= 3½ cubic feet.
1 kiloliter	= 1 tun 12 gallons 2 pints 2 gills old wine-measure.
1 hectoliter	= 22.01 imperial gallons, or 26.4 United States gallons.
1 decaliter	= 2 gallons 1 pint 2½ gills imperial measure, or 2 gallons 2 quarts 1 pint $\frac{1}{2}$ gill United States measure.
1 liter	= 1 pint 3 gills imperial, or 1 quart $\frac{1}{4}$ gill United States measure.
1 deciliter	= 0.704 gill imperial, or 0.845 gill United States measure.
1 millier	= 1 ton avoirdupois less 35 pounds.
1 metric quintal	= 2 hundredweight less 2½ pounds, or 220 pounds 7 ounces.
1 kilogram	= 2 pounds 3 ounces 4½ drams avoirdupois.
1 hectogram	= 3 ounces 8½ drams avoirdupois.
1 decagram	= 154.32 grains troy.
1 gram	= 15.43234874 grains.
1 decigram	= 1.5432 grains.
1 centigram	= 0.15432 grain.
1 milligram	= 0.015432 grain.

Closely connected with the metric system was the proposed division of the right angle or circular quadrant into 100 equal parts instead of 90 degrees; but this has not met with favor, mainly because the name *degrees* was retained, introducing a risk of confusion. See *grad*<sup>2</sup>.

It was so called because in the primitive Doric, of which the later triglyphs represent the ends of the ceiling-beams, the metopes were left open as windows, and were thus literally apertures between the beams. 1. The art of versification.—2. The science or doctrine which treats of rhythm in language and its employment in poetic composition. Both as an art and as a science metrics is a branch of rhythmic, and relates to rhythm in language as music or harmonics does to musical rhythm, and orchestrics (regarded as an art or science by the ancients) to rhythm in the movements of the body. It is a distinct science from grammar in its proper sense, the only department of which approaching metrics is that called *prosody*—that is, the study of quantity or the determination of longs and shorts in spoken language. As a matter of convenience grammars have added to this elementary or empiric treatises on versification, and so in traditional and popular usage *prosody* is made equivalent to *metrics*. In metrical composition the unit is the time (mora) or the syllable. In the nomenclature of modern metrics syllables combine into feet or measures, these into lines, and lines into stanzas or strophes. In the more exact and complete terminology of ancient metrics times or syllables combine into feet or measures, measures into cola, lines (verses) or periods, periods into systems or strophes, strophes into pericopes, and lines, periods, systems, or pericopes into poems. Also *metric*.

**metronome** (mē'trō-nōm), *n.* [= F. *metronome*, *< Gr. μετρον*, a measure, + *νομος*, law; see *nomos*.] A mechanical contrivance for marking time, especially as an aid in musical study or performance. In its usual form it consists of a double pendulum (oscillating on a pivot near its center), the lower end of which is weighted with a ball of lead, while the upper end carries a weight of brass that may be moved up or down. When the latter weight is moved up, the rate of oscillation is slower; when it is moved down, the rate is faster. The upper end of the pendulum is graduated, so that any desired number of oscillations per minute can be secured. The whole is connected with clock-work having a strong spring, whereby the oscillation may be maintained for several minutes, and each oscillation may be marked by a distinct tick or clack. The invention of the metronome was claimed by J. S. Maelzel in 1816, but it is probable that he only adapted and introduced it to general use. The instrument is used for recording the tempo desired by a composer, and also as a means of teaching beginners the habit of keeping strict time. Its use is indicated in printed music by the *metronomic mark* (which see, under *mark*<sup>1</sup>). Sometimes an attachment is added for striking a bell at every second, third, fourth, or sixth oscillation, so as to mark primary accents: such a metronome is called a *bell-metronome*. Various other metronomes have been invented, most of which are based upon the pendulum principle. Abbreviated *M*.

tical superintendence over the bishops and churches of his province, confirmed, ordained, and when necessary excommunicated the bishops, and convened and presided over the provincial synods. The superiority in rank of the bishops of the principal sees was so early established that many authorities have held that the office of metropolitan (including also under this title the primates of patriarchal sees) was of apostolic origin. In the developed organization under the Christian emperors a metropolitan ranked above an ordinary bishop and below a patriarch or exarch. In medieval times the power of most of the metropolitans in western countries became much diminished, while that of the diocesan bishops and the pope was relatively increased. (Banks, 1788), < Gr. μετρη, the pith or heart of a tree, lit. womb, + σιδερος, iron: see siderite.*] A genus of plants of the natural order *Myrtaceæ* and the tribe *Septaspermæ*, type of the subtribe *Metrosideræ*. They are trees or shrubs, sometimes climbers — a few climbing when young, and independent when old. The ovules are arranged in many series, and horizontal or ascending; the leaves are opposite and feather-veined; the flowers are usually showy, prevailing red, strongly marked by their crown of very numerous long erect stamens, and borne in dense terminal three-forked cymes. There are about 20 species, growing chiefly in the Pacific islands, from New Zealand to the Sandwich Islands, one species each in tropical Australia, the Indian archipelago, and South Africa. *M. vera* is the iron-tree of Java, and *M. robusta* the rata of New Zealand. Various species are known in cultivation. Nine fossil species of this genus have been described, chiefly from the European Tertiary, but one occurs in the Middle Cretaceous of Greenland.

They bear fruit but once, and are characterized by robust stems and branching spikes. They are large trees with terminal suberect pinnately cut leaves having opposite linear-lanceolate segments; the spadix has a coriaceous prickly spathe. Seven species are known, indigenous in the Malay archipelago, New Guinea, and the Fiji Islands. *M. levis* and *M. Rumphii*, natives of Siam, the Malaysian islands, etc., are the proper sago-palms. The former grows from 25 to 50 feet high, and has a rather thick trunk, covered with leaf-scars, which bears a graceful crown of large pinnate leaves, from the center of which arise the pyramidal flower-spikes. The latter is a much smaller tree, further distinguished by the sharp spines borne on its leaves and flower-sheaths. These trees flower when about fifteen years old, and require nearly three years to ripen their fruit, after which they die. (See *sago*.) *M. Rumphii* is a littoral tree which forms dense growths; *M. levis* grows in swamps. *M. amicarum*, a species in the Friendly Islands, yields seeds which serve as a vegetable ivory.

mighty, and so placed in a small hollow cylinder that the divine name is visible through an opening covered by a glass. This cylinder is affixed to the right-hand door-post in Jewish houses. The Jews believed that the mezuzah had the virtue of an amulet in protecting a house from disease and evil spirits.

Every pious Jew, as often as he passes the *mezuzah*, in leaving the house or in entering it, touches the divine name with the finger of his right hand, puts it to his mouth, and kisses it, saying in Hebrew: "The Lord shall preserve thy going out and thy coming in from this time forth, and even for evermore" (De. exxi. 5).

This surface is left nearly undisturbed in the deepest shadows of the subject, but is partially removed in the middle tints, and completely in the highest lights. Thus treated, the plate, when inked, prints impressions graded in light and shade according to the requirements of the design, from a rich velvety and perfectly uniform black up through every variation of tone to brilliant white, or showing, when desirable, the sharpest contrasts between the extremes. This style of engraving, invented by Van Siegen, a Dutchman, in 1644, though erroneously ascribed to his pupil Prince Rupert, has been pursued with much success in England. The defect of the process is that it does not admit of clear and sharp delineation of forms; hence in modern practice the outline of the design is strongly etched with acid before the cradle is used, and texture is often given to the finished plate by lines produced by dry point etching.

**mica**<sup>1</sup> (mī'kă), *n.* [= *OF. (and F.) mir* = *It. mica*, < *L. mica*, a crumb, grain, little bit. Hence *Nlt. miche* and *mmb*; see *mic*.] A crumb; a little bit. *E. Phillips, 1706.*

**mica**<sup>2</sup> (mī'kă), *n.* [= *F. mica* = *Sp. Pg. mica*, a mineral, < *NL. mica*, a glittering mineral (see *def.*), < *L. mica*, a crumb (cf. *mica*<sup>1</sup>), prob. applied to the mineral on the supposition that it was related to *L. micare*, shine, glitter.] 1. One of a group of minerals all of which are characterized by their very perfect basal cleavage, in consequence of which they can be separated easily into extremely thin, tough, and usually elastic laminae. They occur in crystals with a prismatic angle of 120°, but more commonly in crystalline aggregates, often of large plates, but sometimes of minute scales, having a foliated structure, the folia being generally parallel, but also concentric, wavy, and interwoven, and also arranged in stellate or plumose and sometimes almost fibrous forms. In crystallization the micas belong to the monoclinic system, but they approximate very closely in form in part to the orthorhombic system (e. g., muscovite), in part to the rhombohedral system (e. g., biotite). The micas are silicates of aluminum with other bases, as iron, calcium, magnesium, potassium, sodium, lithium; in some kinds fluorine is present in small amount. The prominent varieties are — *muscovite* or common potash mica, the light-colored mica of granite and similar rocks, and *paragonite*, which is an analogous soda species; *biotite*, or magnesia mica (including microcline and anorthite, distinguished according to the position of the optic axial plane), the black or dark-green mica of granite, hornblende rocks, etc.; *phlogopite*, the bronze-colored species common in crystalline limestone and serpentine rocks; *lepidomelanæ*, a black mica containing a large amount of iron; and *tephrodolite*, the rose-red or lilac lithia mica occurring commonly in aggregates of scales. (See further under these names.) The micas enter into the composition of many rocks, including the crystalline rocks, both metamorphic and volcanic (as granite, gneiss, mica schist, trachyte, diorite, etc.), and sedimentary rocks (as shales and sandstones), sometimes giving them a laminated structure. In the sedimentary rocks they are in most cases derived from the disintegration of older crystalline rocks. Mica

(muscovite) is often used in thin transparent plates for spectacles to protect the eyes in various mechanical processes, in reflectors, instead of glass in places exposed to heat, as in head lights and stove- and lantern-lights, and even for windows in Russia (hence called *Muscovy glass*). Ground to powder, it is combined with varnish to make a glittering coating for wall-papers, and is used also in preparing a covering for roofs, and as a packing and lubricator for machinery. It is often vulgarly called *isinglass*. The so-called *brittle micas* include a number of species, as margarite, scyolite (clintonite), etc., which are related to the true micas, but are characterized by their brittle folia. 2. In the preparation of kaolin for use in the manufacture of porcelain, one of the second set of channels through which a mixture of water and suspended clay washed out by the water from the broken clay-bearing rock is slowly passed to obtain the deposition of flakes of mica and other foreign substances, and thus to purify the clay, which is finally allowed to subside in a series of pits or tanks. Each of the first set of channels through which the mixture is passed for the settling of the coarser flakes of mica, etc., is called a *drag*. This set of channels is collectively called the *drags*, and the second set the *micas*. See *porcelain* and *kaolin*. — **Copper mica.** Same as *chalcophyllite*. — **Lithia mica.** Same as *tephrodolite*. — **Mica-powder**, giant-powder in which mica in fine scales takes the place of the silicious earth. *Eissler, Mod. High Explosives, p. 353.*

**micaceous** (mī-kă'shius), *a.* [= *F. micacé* = *Sp. micáceo* = *Pg. It. micaceo*, < *NL. mica*, mica; see *mica*<sup>2</sup>.] 1. Pertaining to or containing mica; resembling mica or partaking of its properties, especially that of occurring in foliated masses consisting of separable laminae: as, *micaceous structure*. — 2. **mica-schist** (mī-kă'shist'), *n.* A rock made up of quartz and mica, with a more or less schistose or slaty structure. The relative proportion of the two minerals differs often very considerably even in the same mass of rock. The usual mica in a typical mica-schist is the species called muscovite; this, however, is sometimes replaced to a certain extent by biotite or paragonite. Mica-schist passes readily into tale-schist and chlorite-schist; and when feldspar is added to the other constituents of the rock it becomes gneiss. It is one of the most abundantly distributed of the so-called crystalline or metamorphic rocks, and, with granite, gneiss, and the other members of the schist family, forms the main body of the rocks formerly designated as *primitive*.

**mica-slate** (mī-kă'slät'), *n.* The common name of the rock now usually designated by lithologists as *mica-schist*.

**micella** (mi-sel'ä), *n.*; pl. *micellæ* (-ä). [*NL.*, dim. of *L. mica*, a crumb, grain; see *mica*<sup>1</sup>.] One of the hypothetical crystalloid bodies or plates supposed by Nägeli to be the units out of which organized bodies, more particularly plants, are built up. These micellæ were supposed to be aggregates of larger or smaller numbers of chemical molecules, and were determined by the optical properties exhibited by cell-walls, starch-grains, and various proteid crystalloids. From their optical properties it was concluded further that they were biaxial crystals, and they were assigned, as a probable form, that of parallelepipedal prisms with rectangular or rhomboid bases.

The usage of later lithologists differs considerably in the application of this term. By some it is regarded as the equivalent of *crystallite*, which is properly an aggregation of microscopic globular forms (globulites). By others crystallites are considered as differing from microliths in that the latter have the internal structure of true crystals, while in the former this cannot be recognized. Elongated or lath-shaped forms and such as resemble an hour-glass in shape are those now most generally designated as *microliths*; if curved or more or less twisted or hair-like, they are frequently called *trichites*. Microliths are most frequently seen in rocks of igneous origin, and are especially abundant as products of the devitrification of the glassy lavas. The feldspars, hornblende, augite, and apatite are minerals most commonly found assuming this form.

The species, numbering about 60, are low herbs or somewhat shrubby plants, sweet-odorous, of various habit, distributed pretty widely in the Old World, with a few in South America and the West Indies, and two or three in the United States. *M. **micrometer** (mī-krom'e-tēr), *n.* [= *F. micromètre* = *Sp. micrómetro* = *Fr. It. micrometro*, *< Gr. μικρος, small, + μετρον, measure.*] An instrument for measuring microscopic lengths and angles. All micrometers depend upon two principles, magnification and oblique measurement. Magnification determines an angle by measuring the arc that subtends it upon a circle of large fixed radius, having its center coincident with the vertex of the angle. Thus, a mirror turning through a small angle may reflect a spot of light upon a distant scale. Oblique measurement (see *diagonal scale*, under *diagonal*) ascertains a length by measuring the distance at which it subtends a small fixed angle. Thus, the *wedge-micrometer* is a long wedge-shaped piece of metal or glass with its sloping sides as truly plane as possible, and graduated along its length. It is used to measure the distance between two points having a rigid circumscribed connection, but a vacant space about the line between them. The wedge being thrust between the points, the distance it penetrates shows how far apart they are. The principle of oblique measurement is, in nearly all micrometers, applied under the form of a fine screw, the number of whose revolutions and parts of a revolution, in advancing from one point to another, measures the amount of this advance. In this case the pitch of the screw is the fixed angle, while the reading of the screw-head is proportional to the variable radius at which this angle is subtended by the length to be measured.—**Annular or circular micrometer**, a micrometer consisting, in its most approved form, of a disk of parallel plate glass, having in its center a round hole to the edges of which a ring of metal is cemented and afterward truly turned in a lathe. The disk being mounted in a brass tube, so that it may be accurately adjusted in the focus of the eyepiece and applied to a telescope, the metal ring is alone visible, and appears as if suspended in the atmosphere, whence the instrument is called the *suspended annular micrometer*. Brande and Cox, *Diet.*, II. 516 (changed).—**Double-image micrometer**, a micrometer having an optical apparatus which produces two images of every object, as A and A', B and B'. Then, A may be brought into coincidence with B, or B may be brought into coincidence with A', and the position of the parts producing the double image will then show the distance between A and B.—**Filar micrometer**, a micrometer in which the two objects whose distance is to be measured are brought into coincidence with two spider-lines in the principal focus of a telescope or microscope, one of these webs being movable by turning a micrometer-screw. The astronomical filar micrometer is also provided with a graduated position-circle, apparatus for illumination, etc.—**Micrometer-balance**, a form of balance adapted to the exact determination of very small weights or differences in weight. That devised by Kershaw for testing the weight of gold pieces consists of a steady support on a knife-edged fulcrum and geared with a wheel graduated to half-grains. If the coin is of correct weight, the index points to zero. If it is light, the leverage of the beam turns the wheel until equilibrium is attained, when the index-bar points to the number of half-grains of shortage. *E. H. Knight*.—**Mother-of-pearl micrometer**, Cavallo's micrometer, which consists of a thin semitransparent piece of mother-of-pearl,  $\frac{1}{2}$  of an inch wide, having fine graduations. It is mounted within the tube at the focus of the eye-lens of the telescope, where the image of the object under observation is produced.

**micrometer-screw** (mī-krom'e-tēr-skēr), *n.* A screw attached to optical and mathematical instruments as a means of measuring very small angles. The pitch of the screw is made exceedingly small, while the graduated head is large, thus securing great exactness and simplicity in use.

The instrument invented for this purpose by Mr. Hughes in 1878 is based on the fact that when substances possessing little electrical conductivity are placed in the course of an electric current, the conductivity of the system is much increased by even the very smallest amount of pressure. The instrument has various forms, but in most of them one piece of charcoal is held loosely between two other pieces in such a manner as to be actuated by the slightest vibrations conveyed to it by the air or by any other medium. The two external pieces are placed in connection with a telephone, and when the ear is placed at the ear-piece of the telephone the sounds caused by a fly walking on the wooden support of the microphone appear as loud as the tramp of a horse. **microscope** (mī'krō-skōp), *n.* [= F. *microscope* = Sp. *Fig. It. microscopio*, < NL. *microscopium*, < Gr. *μικρός*, small, + *σκοπεῖν*, view.] 1. An optical instrument consisting of a lens or combination of lenses (in some cases mirrors also) which magnifies and thus renders visible minute objects that cannot be seen by the naked eye, or enlarges the apparent magnitude of small visible bodies, so as to render possible the examination of their texture or structure. The *simple microscope*, which is the simplest form, is merely a convex lens, near to which the object to be examined is placed; it is also called a *magnifying-glass* or *lens* (see *magnifying-glass*, under *lens*). The *compound microscope* consists essentially of two lenses, or systems of lenses, one of which, the object-glass or objective, forms an enlarged inverted image of the object, and the other, the eyepiece or ocular, magnifies this image. The eyepiece and objective (see these words) are placed at the opposite ends of the tube or body, which is often made of two closely fitting

parts so that its length (and thus the distance between the glasses) can be varied at will, it is then called a *draw-tube*. The object under examination is placed upon a support, called the *stage*, beneath the objective; its position upon this may be adjusted by the hand, or, better, the object and the stage (then called a *mechanical stage*) are moved together by some mechanical arrangement, as, for example, by two screws giving motions in two directions at right angles. The proper distance between the objective and the object (such that the image of the latter shall be seen clearly, or be *in focus*) is usually attained by the movement of the tube as a whole. This is accomplished by the rapid motion of the *coarse adjustment*, and more slowly and accurately, as is necessary in the case of high powers, by an arrangement called the *slow motion* or *fine adjustment*. The necessary illumination is obtained by a concave mirror below the stage, which reflects the light upon the object. An achromatic condenser, usually in connection with a diaphragm, is often added to converge the light more strongly; for opaque objects a bull's-eye condenser, a Lieberkuhn, or some other form of reflector is employed. The body of the microscope, with the stage, etc., is supported firmly upon a stand, and usually attached by a joint which allows of its being inclined at any desired angle between the vertical and horizontal positions. Many accessories, or special devices applicable to particular uses, may be added to the microscope in its essential form, as a micrometer, polarizing prisms, camera lucida, etc. The compound microscope itself often varies widely in construction, according to the character of the work for which it is to be used. (Compare also the phrases below.)

2. [*cap.*] A constellation. See *Microscopium*.—**Achromatic microscope**. See *achromatic*.—**Binocular microscope**, a microscope so constructed that the object may be viewed simultaneously by both eyes, with the advantage (usually but not necessarily attained) that it is then seen in relief. It has a single objective, but two tubes, each with its own eyepiece; a prism causes the luminous rays from the objective to separate and pass through each tube.—**Double-bodied microscope**, a microscope in which the object under examination can be viewed by more than one person at the same time. As in the binocular microscope, a prism divides the rays from the objective. Two other prisms receive the separated rays, and the respective pencils are directed through the different bodies of the instrument.

**Filar microscope**, a microscope having cross-wires in the focus of the eyepiece.—**Inverted or chemical microscope**, one with the object-glass placed beneath the object and the stage. The luminous rays which have passed down through it are reflected by an inverting prism up the obliquely placed tube to the eyepiece. This form is sometimes used in chemical work, when acid fumes are present.—**Magnifying power of a microscope**. See *magnify*.—**Monocular microscope**, one with a single tube, for use with one eye only.—**Panoramic microscope**, a name sometimes given to a microscope having the eyepiece in a sliding draw-tube (see def. 1).—**Petrographical microscope**, a form of microscope especially adapted for minute study of the structure of rocks. It is provided with a graduated and revolving stage and an arrangement for accurately centering the object-glass. It has also a polarizing apparatus, of which the upper Nicol prism or analyzer is contained in a separate support which can be easily revolved on a graduated circle or removed at will. The lower Nicol or polarizer is supported beneath the stage, and can also be revolved in a graduated collar. With these arrangements the directions of light-extinction in a section of a crystal can easily be determined. Besides the usual eyepiece and object-glass, an additional lens, or series of lenses, can be placed over the lower Nicol prism when converging light is required, as in examining the uniaxial or biaxial interference-figures of crystal-sections.—**Reflecting microscope**, a form of microscope in which the object is placed outside of the tube, or outside the axis of the tube, and reflects its image to the speculum by means of a plane mirror inclined at an angle of 45° to the axis of

It may also be stated by saying that the negative of the negative of any term is included under that term. The converse statement that the negative of the negative of any term includes that term is the *principle of contradiction*. These two principles, taken together, define negation.

And since no proposition can be at once true and false while its terms remain the same, but must be either true or false, under alternative aspects, the *Principle of the Excluded Middle*, which is simply the assertion of such an alternative, is seen to be nothing more than the Principle of Equivalence.

=**Syn. 1.** *Center*, *Midst*, *Middle*. *Center* is a precise word, ordinarily applied to circular, globular, or regular bodies; as, the *center* of a circle, globe, field; but it is used wherever a similar exactness appears to exist: as, the *center* of a crowd. *Midst* regards the person or thing as enveloped or surrounded on all sides, especially by that which is close upon him or it, thick or dense: as, in the *midst* of the forest, the waves, troubles, one's thoughts. Except as thus modified by the idea of envelopment or close environment, the old idea of *midst* as meaning the middle point (see Gen. i. 6; Josh. vii. 23; 1 Kl. xxii. 35) is quite obsolete. *Midst* is very often used abstractly or figuratively, *center* rarely, *middle* never. *Middle* is often applied to extent in only one direction: as, the *middle* of the street, of a block of houses, of a string; it is often less precise than *center*: compare the *center* and the *middle* of a room.

**mignonette** (min-yo-net'), *n.* [*< F. mignonette*, the flower so called, dim. of *mignon*, delicate,

pretty, gracefully pleasing; see *minion*<sup>1</sup>.] 1. A well-known plant, *Rosca odorata*, native in northern Africa. Its racemes of small greenish-white flowers with prominent brown anthers are not showy, but the plant is a universal favorite in gardens on account of its fragrance. In ordinary culture it is an annual, but it is naturally shrubby, and by proper care can be made to thrive for several years in the form of tree-mignonette. The perfume is best extracted by enfleurage.

2. Some other species of the genus *Rosca*. The white mignonette, *R. alba*, a tall plant with white scentless blossoms, has sometimes been cultivated. The wild or dyer's mignonette, *R. tuberosa*, is better known as dyer's-weed or yellow-weed. See *dyer's-weed*.—**Jamaica mignonette**. See *Lawsonia*.—**Mignonette lace**. *W. Irving*, *Sketch-Book*, p. 379.

=*Syn.* *Migrate*, *Emigrate*, *Immigrate*. To *migrate* is to change one's abode, especially to a distance or to another country, emphasis being laid upon the change, but not upon the place of departure or that of stopping, and the stay being generally not permanent. *Emigrate*, to migrate from, views the person as leaving his previous abode and making a new home; *immigrate*, to migrate into, views him as coming to the new place. The Arab *migrates*; the European coming to America is an *emigrant* to those whom he leaves, and an *immigrant* to the Americans. *Migrate* is applicable to animals; the other terms are generally used of the movements of men.

**migration** (mi-grä'shon), *n.* [*< F. migration* = *Pg. migração* = *It. migrazione*, *< L. migratio(n)-s*, *< migrare*, *p.p.* *migratus*, migrate; see *migrate*.] 1. The act of migrating; change of residence or habitat; removal or transit from one locality or latitude to another, especially at a distance. Among animals, the most extensive and regular migrations are performed by birds during spring and fall, and in a general way along meridians of longitude, the vernal migration being northward, the autumnal southward. This is ordinary or equatorial migration. In cold and temperate latitudes of the northern hemisphere nearly all insectivorous birds perform migration. Some, as sandpipers, which breed only in high latitudes, may be dispersed during their migration over a great part of the world. Others, as swallows, are noted not only for the extent but for the rapidity and regularity of their movements, their arrival and departure being capable of prediction with considerable accuracy. The migration of many water-fowls is scarcely less notable in the same respects. Migration seems to be determined, primarily and chiefly, by conditions of food-supply, but this does not fully account for the apparently needless extent and the wonderful periodicity of the movement, nor for the fact that individuals sometimes return to exactly the same spot to breed again, after passing the winter perhaps thousands of miles away. Migrations of mammals are more irregular than those of birds, less definitely related to latitude and longitude, and more obviously dependent upon food-supply; such are the excursions, often in enormous hordes, of various arctic animals, as lemmings and other rodents, reindeer, musk-oxen, foxes, etc. Such movements do not appear to be specially related to reproduction. Many fishes migrate from and back to the sea, ascending rivers to spawn, as is notably the case with anadromous fishes of the salmon and herring families; with eels the case is reversed; with many fishes the catadromous migration is between deeper and shallower, or colder and warmer, salt water. Periodical migration is also marked with certain insects. Thus, *Anoxia pterippus*, the milkweed-butterfly, migrates southward in the fall to hibernate in the pine woods of

the southern United States. The faculty which enables or compels animals to migrate has been named the "instinct of migration"; but the phrase is rather a statement of fact than an explanation of the phenomenon, except in so far as this instinct may be regarded as originating in and being highly developed from the simple necessity of moving about to secure food.

All our adventures were by the fireside; and all our migrations from the blue bed to the brown.

*Goldsmith, Vicar.*

Adventures that beguiled and cheered

Their grave migration. *Wordsworth, Excursion, vii.*

Our remote forefathers must have made endless earlier migrations as parts of the great Aryan body, as parts of the smaller Teutonic body. But our voyage from the Low-Dutch mainland to the isle of Britain was our first migration as a people. *E. A. Freeman, Amer. Lects., p. 31.*

2. A number of animals migrating together; the total of the individuals or species which perform any particular migration; also, the time or period occupied in migrating.—3t. Change of place; removal.

**Bathic migration**, migration of fishes from one depth of water to another; vertical or altitudinal change of habitat in the sea; distinguished from *equatorial migration*.

Mikán, a Bohemian botanist (1769-1844).*] A genus of composite plants of the suborder *Tubuliflorae*, the tribe *Eupatoriaceae*, and the subtribe *Agerateae*. The principal characteristics are an involucre of four slightly unequal bracts, four-flowered heads which are racemed or panicle, and pappus with very numerous scabrous bristles arranged in one row. The plants are shrubs or herbs, which are almost always climbing or twining, with opposite leaves, and small white, flesh-colored, or pale yellowish heads. About 140 species have been enumerated, but they may probably be reduced to 100. *sus*, a step; see *pace*.] An itinerary measure, modified from that of the Romans, which was equal to 1,617 English yards; used in the British empire, in the United States, and, formerly, in most European countries. The ordinary or statute mile is equal to 8 furlongs = 320 perches or poles = 1,760 yards = 5,280 feet; it was rendered legal by a statute of the thirty-fifth year of Elizabeth's reign, which prohibited building within three miles of London. This mile was probably intended to be about the length of a minute on the earth's surface, but the perch, of which it is an exact multiple, already existed. The square mile is 640 square chains, or 640 acres. The nautical or geographical mile has been variously defined; see phrase below. The medieval English mile (divided into 10 furlongs) was equal to 6,610 feet or 2,015 meters. The old London mile was 5,000 feet. The miles of continental Europe were of the most various lengths, and mostly represented, as it would seem, multiples of some modified Roman mile. The ancient Scottish mile was 1,766 yards = 1,133 English miles; the Irish mile, 2,240 yards = 1,273 English miles (11 Irish miles being 14 English miles). The Welsh mile was nearly

1 miles English. The following table shows the values of some of the principal miles in meters:

**Geographical or nautical mile**, a mile variously defined as: (1) the mean length of a minute of latitude = 6,082.66 feet; (2) the length of a minute of the meridian corresponding to the radius of curvature of the particular latitude, varying from 6,045.95 feet at the equator to 6,107.85 feet at the poles; and (3) the length of a minute of longitude on the equator = 6,087.15 feet. To remove all uncertainty, the United States Coast Survey has adopted the value of the nautical mile as equal to one sixtieth part of the length of a degree on the great circle of a sphere whose surface is equal to the surface of the earth. This value gives one nautical mile = 6,080.27 feet, which is very nearly the value of the Admiralty knot (6,080 feet) adopted by the British Hydrographic Office. — **Three-mile limit, belt, or zone** (also called the *marine belt*), in international law, that part of the margin of the high seas which is within the jurisdiction of the nation possessing the coast, originally determined by the circumstance that, at the time this limit became generally recognized, a marine league approximated fairly to the distance at which cannon on the shore would serve to command the water. 1 *Wart. Dig. Int. Law*, 114, § 32.

An allowance or compensation for travel or conveyance reckoned by the mile; especially, payment allowed to a public functionary for the expenses of travel in the discharge of his duties according to the number of miles passed over; as, the *mileage* of a sheriff, circuit judge, or member of Congress or of a legislature.

A white or bluish-white liquid secreted by the mammary glands of the females of the class *Mammalia*, and drawn from their breasts for the nourishment of their young. It is opaque, with a slight peculiar odor and a bland sweetish taste. Its chemical constituents in different mammals are qualitatively alike, but quantitatively vary much, not only in different species, but also in different individuals, or even at different times in the same individual. The amount of water varies from about 80 to 90 per cent., the residue being composed of albuminoids (casein and lactoprotein), fat, milk-sugar, and certain salts, chiefly phosphates.

Under the microscope it appears as a clear transparent fluid, in which a large number of minute globules are suspended. When allowed to rest, these globules rise to the surface, forming a yellowish stratum, the *cream*, which consists mainly of the fat, mixed with some casein, and retaining some serum. In the cow about 5 per cent. of the milk is cream, in the human female less, in the mare scarcely more than 1 per cent. By churning the globules unite to form butter, leaving the *butter-milk*, which is essentially a solution of milk-sugar, with the salts and some casein and butter. The milk from which cream is separated is *skimmed milk*, which when left to itself or not too cold develops, from the action of a certain bacterium, lactic acid, which separates the casein in a coagulated condition called *curds*; the same effect is produced by some other acids, and by rennet, the prepared inner membrane of the stomach of a calf. The liquid separated from the coagulum is called *whey*, and contains chiefly

Drop of Milk, showing fat globules highly magnified.

milk sugar and some salts. Cheese is prepared by coagulating milk with rennet, allowing the whey to separate, and adding salt to the curd. The specific gravity of both cow's and human milk is about 1.030. Human milk is always alkaline, cow's milk either alkaline or acid, while the milk of carnivora is always acid. Milk represents a complete or typical food, in which all the constituents necessary for maintaining the life and growth of the body are present. In rare instances milk, in greater or less abundance, is secreted by the mammary glands of the adult human male.

1. A mechanical device for grinding grain for food. Ancient mills, and those still in use in uncivilized or half-civilized countries, are simple devices for rubbing or pounding the grain, commonly two stones, one of which is moved upon the other by hand. The common modern mill consists essentially of two flat circular stones, one of which is moved upon the other, and between which the grain is triturated. The bedstone and runner are together called a *run of stones*. In some mills the under stone is the runner. Such a mill is called an "under-runner," while an "upper-runner" is one like that shown in the cut. The bush, *g*, in the bedstone is fastened in its place by wedges.

The balance-rynd, *j*, is a curved bar which crosses the eye or central opening of the runner on the under side at the margin of the eye and supports the stone. The supporting bearing of the balance-rynd is a central socket called a *cock eye*, and the supporting point of the spindle which fits the cockeye is called the *cockhead*. The spindle, balance-rynd, and runner stone are raised or lowered by means of the bridge-tree and lighter-screw to adjust the runner properly in relation to the bedstone. The hopper, *p*, receives the grain to be ground, and delivers it to the shoe, which is loosely supported, and kept constantly vibrating by the rotation of the damsel, a sort of trundle-wheel, the trundles of which chatter against the shoe. Flour is also made by cylinder-mills or roller-mills. The rollers act by crushing, by crushing and rubbing, as when they are caused to run with different peripheral velocities, or by a cutting or scraping action, as when they are serrated and revolved in such manner that the cutting edges of one roller act toward the cutting edges of the other.

Grinding-mill.

*a*, bedstone; *b*, runner; *c*, step or ink; *d*, bridge-tree; *e*, eye; *f*, hopper; *g*, hopper; *h*, shoe; *i*, spout; *j*, damsel; *k*, lighter-screw; *l*, bush.

3. A machine which transforms raw material by a process other than grinding into forms fit for uses to which the raw material is unfitted. In this use also the word is generally in composition, as

4. A machine which does its work by rotary motion, especially a lapidary wheel.—5. A treadmill. [Colloq.]

A few weeks after I was grabbed for this, and got a month at the mill; but I was quite innocent of priggish. [Quoted in *Mythen & London Labour and London Poor*, I, 300.]

Those works in which the reduction is performed by the aid of fire are usually designated *smelting works*, or sometimes especially in the case of iron *furnaces*. In the manufacture of iron a *mill* is an establishment where the metal in the rougher form (that is, in that of blooms, slabs, rough bars, etc.) is worked up into various kinds of merchantable iron, or into those forms which are desired by the different classes of consumers of the metal, such as rails, plates, merchant bars, and many other similar products. (c) A large building used as a factory, and occupied by machinery for the purposes of manufacture; as, a silk-mill; a cotton-mill.—7. In *calico-printing* or *book-note engraving*, a soft steel roller which receives under great pressure an impressed design in relief from a hardened steel engraved roll or die, and which is used in turn, after being hardened, to impart the design in intaglio to a calico-printing roll or note-printing plate.—8. 9. A kind of screw-press introduced during the reign of Elizabeth into England from France, and designed to supersede the manufacture of gold coins by the primitive method of striking dies with a hammer. It was introduced in 1561, discontinued in 1572, reintroduced in 1654 and 1658, and permanently adopted shortly after the restoration of Charles II. The more modern coining-press has supplanted this machine. The mill not only struck the legend, but also raised the rim on the margin and serrated the edge. These serrations were at first straight; but, having been found easy to imitate by filing, they were made curvilinear in the reign of George II.

**Barker's mill**, an ingenious machine, moved by the centrifugal force of water, invented by Dr. Barker. It consists of a vertical axis *CD*,

moving on a pivot at *D*, and carrying the upper millstone *m* after passing through an opening in the fixed millstone *n*. Upon this vertical axis is fixed a vertical tube *TT*, communicating with a horizontal tube *AB*, at the extremities of which, *A* and *B*, are two apertures in opposite directions. When water from the mill-course *MX* is introduced into the tube *TT*, it flows out of the apertures *A* and *B*, and by the pressure of the water on the parts of the tube opposite the apertures the arm *AB*, and consequently the whole machine, is put in motion. The bridge-tree *ab* is elevated or depressed by turning the nut *c* at the end of the lever *cb*. The grain to be ground is poured into the hopper *H*. As modified by Whitelaw it is used in Great Britain under the name of *Scotch turbine*. See *turbine*—**Cannon-ball mill**. See *cannon ball*.—**Chilian mill**, a form of mill consisting of two heavy wheels or rollers, set parallel on a horizontal shaft, and having a double rotation, that on the horizontal shaft, and a second around a vertical axis controlling the horizontal shaft. The rollers travel in a vat or other suitable receptacle, and scrapers are usually provided to keep the material in the path of the wheels. This form of mill, which is of much antiquity, is now used especially for grinding oleaginous seeds, nuts, fruits, etc. See *aristote*.—**Cone-and-cradle mill**, a mill having a conical miller or grinder reciprocating in a semi-cylindrical concave or bed. *E. H. Knight*.—**Crooke's mill**, an occasional name for Crooke's radiometer (which see, under *radiometer*).—**Edge-runner mill**, a mill in which the millstones grind by their peripheral surfaces instead of by their flat surfaces. The stones are generally two in number (though a single one is sometimes used), and run in a circular trough provided with a bottom of stone or of iron. The trough holds the material to be ground. The stones are pivoted to the ends of an axle like cart-wheels, and the axle is attached in the middle to a vertical shaft which rolls the stones around in the trough,

thus effecting both a rolling and a rubbing action upon the material to be ground. Such mills are used for grinding flaxseed preparatory to expressing the oil, in iron-foundries for grinding sand and clay, and for other purposes.—**Horizontal mill**, a mill having the acting surfaces in a horizontal plane at right angles to the vertical axis of the revolving stones, as in a grain grinding mill.—**Hydraulic, lapidary, etc., mill**. The clay, being thrown in at the top, is kneaded, cut, and pressed by the revolution of the shaft, and when it emerges from the bottom is plastic and ready for molding. See *page-mill*.

To flute: the edge of, as of a coin, or of any flat piece of metal, as the head of a milled screw or the rim of a metal box-cover, to afford a hold for the fingers. The screws of optical and surgical instruments, and other philosophical apparatus, and also the covers of lubricators for machinery, are commonly milled.

**millenarianism** (mil-e-nā'ri-an-izm), *n.* [Sometimes inprop. *millennarianism*; *cf. millenarian* + *-ism*.] The doctrine of or belief in the coming of the millennium; the doctrine of the reappearance of Christ on earth, the establishment of his kingdom, the resurrection of the saints and of the remaining dead for the general judgment, and an intervening period of a thousand years (or of indefinite length) of perfect righteousness. In the early church the doctrine of millenarianism (chiliasm) was generally held, and many, both of the otherwise orthodox and of heretics, were accused of holding it in a literal or even a gross and sensual sense. Thus, after the fourth century it fell into general disfavor. As A. D. 1000 approached there was a wide-spread panic throughout Europe, under the idea that the prophetic thousand years had expired and that Satan would be let loose. Millenarianism showed itself again in the views of Anabaptists, Fifth Monarchy Men, Millerites, etc. See *chiliasm*, *millennium*, *premillennialism*, *postmillennialism*.

*G. Rantoul, Origin of Nations*, I, 151.

Specifically—**2.** In *theol.*, a period during which the kingdom of Christ will be established upon the earth and will predominate over all other authority. The phrase "a thousand years," in Rev. xx, 1-6, has been understood literally, or on the principle that in Scripture prophecies a day stands for a year, and the Jewish year contained 360 days as representing 360,000 years. It is generally regarded as indicating an indefinite but long period, and belief in such a period is universal in the Christian church. But whether this predominance of the kingdom of Christ will be accomplished gradually by the gospel, and will precede Christ's second coming, or will follow his second coming and be accomplished by it, is disputed. This question divides theologians into two schools, the postmillenarians, who hold the former view, and the premillenarians, who hold the latter; while many hold that the millennium represents the gospel dispensation or reign of the church, and has accordingly already prevailed for many centuries.

**milleped**, **milleped** (mil'e-ped, mil'i-ped), *n.* [= *F. millepieds* = *Sp. milpieds* = *Pg. milhpedes* = *It. millepiedi*, *< L. milh pedia*, *< mille*, thousand, + *pes* (ped-) = *F. foot*.] **1.** A thousand-legs; a myriapod of the suborder Chilognatha or Diplopoda; so called from the very numerous feet, though these are not nearly a thousand in number. The feet are about twice as numerous as those of the similar creatures called centipeds, there being two

pairs instead of one pair to most of the segments; the legs are also shorter, and the body is harder and more cylindrical. Millepeds are found in water, and in wet or damp places beneath logs, stones, etc. Unlike some of the centipeds, all are quite harmless animals. Some of the commonest belong to the family Julidae, as *Julus subulonus*. The tufted millepeds are Polydesmidae; the false millepeds, Polydesmidae. Mill-millepeds belong to the family Glomeridae; they are comparatively short and stout, and can roll themselves up into a ball, like the wood lice of the genus *Armadillo*. Millepora*, *< L. mille*, a thousand, + *porus*, a passage; see *por*.] A coralline hydrozoan of the family Milleporidae. The millepores were long supposed to be corals, and such is their appearance and the part they play in the formation of reefs. They belong, however, to a different class of animals, the Hydrozoa (not Actinozoa), being among the few members of their class which form a hard calcareous polypary or polypoid like the stercorals, and the leading representatives of the order called Hydrocoralline (which see). The incrusting substance forms a dense deposit upon the outer surface of the ramified hydrosome. There are two kinds of zooids or polypites: short broad alimentary zooids (gastrozooids) with 4 or 6 tentacles, surrounded each by a zone of from 5 to 20 or more long mouthless zooids (dactylozooids) with numerous tentacles, having no ampullae. The zooids are dilated at their bases, and there give off tubular processes which ramify and imbricate, giving rise to a thin hydrosome.

**Milleporidae** (mil'e-pōr'i-dē), *n. pl.* [NL.; *< Millepora + -idae*.] A family of hydrocoralline hydrozoans, typified by the genus *Millepora*. See *millepore* and *Hydrocoralline*.

The seed properly treated makes a bread of good quality, and is a good grain for quadrupeds and fowls. The plant serves also for forage. This is the *dura* or *dumra* of Africa and India. It has been introduced to some extent into the United States, where it is sometimes called *coffee* or *chouda* or *ra*, because of its attempted use as a substitute for coffee. **1.** The process of grinding, or subjecting materials to the action of the machinery of a grinding-mill. Specifically—**2.** The manufacture of cereals into flour or meal. The manufacture of fine flour is now carried on by two distinct methods, respectively called *low milling* and *high milling*. Low milling prevailed almost universally until a recent period; but it is now largely superseded by high milling, by which an increased product and a much purer quality of flour are obtainable, especially from wheat inferior to the higher grades. In low milling the grain is ground only once and then bolted. In high milling it is subjected to repeated grindings. The earlier grinding or grindings decorticate the grain, which, being subjected after each grinding to screening and blowing in the middlings purifier, is freed from adherent impurities, and from parts which envelop the finer nutritious portions. The latter thus cleaned are called *semolina* (half-ground). The semolina is then subjected to grinding, cylinder-milling, or disintegration milling, to complete its conversion into fine flour. Cylinder-milling, also called *roller-milling*, is the manufacture of flour by the use of cylinder-mills. Disintegration milling is the manufacture of flour or meal by the use of the disintegrator. See *mill*<sup>1</sup>.

**3.** The operation of upsetting the edge of a coin-blank to form the milled edge; also, the operation of patting the series of small transverse ridges and furrows on the edge of an otherwise finished coin, or on a screw-head to adapt it for easy turning with the fingers. See *milled screw*, under *screw*.—**4.** A method of shaping metals in a milling-machine, by passing the metal under a serrated revolving cylinder or cutter.—**5.** In *metal-working*, a method of ornamenting metallic surfaces by treatment in a lathe with ribbed tools, which produce ridged surfaces.—**6.** A method of softening and opening the pores of hides by placing them with some tan-liquor in a wooden drum which is caused to revolve.—**7.** The felting or fulling of a cloth to thicken it.

The term *milling* embraces all those operations which are calculated to effect the felting of the woolen fibres in the fabric by means of pressure or friction.

*mölst* in = Dan. *mölst*, a millstone, *< mylen*, mill, + *stän*, stone; see *mill* and *ston*.] One of a pair of cylindrical stones used in a mill for grinding grain. The kind of stone best adapted for this use is known as *burstone*, and is found in France and

Methods of Dressing Millstones.

in Georgia, U. S. The two stones are placed one over the other; and in the operation of grinding one of them remains at rest and is called the *bed*, while the other, usually the upper stone, revolves and is called the *runner*. (See *mill*, 1.) The face of a millstone is cut with lines or channels called *furrows*, which lead from the center to the circumference and have flat spaces between them called *land*. The furrows and land are together called the *dress*; they are arranged in various ways. A smoken space about the eye of the stone is called the *bosom*.

**millstone-dresser** (mil'stön-dres-ër), *n.* 1. A workman whose business is to dress millstones. — 2. A machine for forming millstones, especially for cutting the furrows on the face of a millstone. Such machines range from hand-appliances having pivoted hammers for picking and clipping the stone to large power-machines employing rotary disks and mandrels armed with diamonds or borers, and include a great variety of machines which cause cutters to travel in radial lines over the face of the stones, as well as lathes in which the stone is made to revolve before traversing tool-rests carrying cutting-mandrels in rapid revolution. Smaller machines are portable, and are guided by hand over the stone while the cutting-tool is revolved at a high speed by means of a belt.

**millstone-driver** (mil'stön-dri-vër), *n.* The device on a millstone-spindle which drives the runner by impinging against its bail.

**millstone-feed** (mil'stön-fed), *n.* A device by which the quantity of grain fed to a millstone is regulated, as by means of an adjustable gate in the aperture of the hopper.

**millstone-grit** (mil'stön-grit), *n.* A silicious conglomerate rock, so called because it has been worked for millstones in England. It constitutes one of the members of the Carboniferous group, underlying the true coal measures, and overlying the mountain limestone. In Wales and southwestern England it is known as "farewell rock," because when the miners strike it they bid farewell to profitable seams. The millstone-grit is an important and persistent member of the Carboniferous series both in Europe and in the United States. In parts of England it attains a thickness of over 5,000 feet. Where the series to which this name is given is developed to this extent, however, it contains intercalated beds of shale and clay and even of coal. In Pennsylvania the millstone-grit is sometimes called the *Great* or *Pottsville Conglomerate*. At Pottsville, on the eastern edge of the anthracite fields, it is over a thousand feet thick, but it thins very much in going west.

The Fourth Sand-Rock is the well-known No. XII., or the Great Conglomerate. It has its representation in the *millstone grit* beneath the European coal. It is the floor of the true coal measures, an immense preparatory outspread of sand and pebble-stones of every variety, but chiefly pure white quartz and of every size, from the minute mustard seed and pepper corn to the hen's egg and in the Susquehanna region even the ostrich egg.

A large genus of leguminous plants of the suborder *Mimosa* and the tribe *Eumimosae*, characterized by a legume with entire or jointed valves which break away from a narrow persistent placenta. The plants are either herbs, erect or climbing shrubs, or sometimes trees, and are often prickly. The leaves are almost always bipinnate, but rarely there are none, or the expanded petiole (phyllocladum) takes the place of the leaf; and in many species the leaves are sensitive, closing when touched. The flowers are small and sessile, usually having the stamens very much longer than the corolla; they are arranged in globular heads or in cylindrical spikes. About 250 species have been described, natives of the warmer parts of America and Africa, of tropical Asia, and of the Mascarene Islands. Many are cultivated, the most common being the sensitive-plant or humble-plant of hothouses, *M. pudica*, which is a branching annual, one or two feet in height, having a great many small leaflets, all highly sensitive when touched. *M. myriophylla* is a woody climber of tropical America, and is remarkable for the great height which it attains, ascending to the tops of the tallest trees.

Thus the American starlings (*Tetridae*) are mimotypes of the Old World starlings (*Sturnidae*); the American genus *Geomys* is mimotype of the African *Georchus*; the American jumping-mouse (*Zapus*) replaces the jerboa (*Dipus*) of Africa.

*Mimotypes*, forms distantly resembling each other, but fulfilling similar functions. . . . By the use of this term, the word "analogue" may be relieved of a part of the burden borne by it.

**mimotypic** (mim'ō-tīp'ik), *a.* [*< mimotype + -ic.*] Having the character of a mimotype.

The subtribe embraces 6 genera, *Mimulus* being the type, and about 56 species.

**Mimulus** (mim'ū-lus), *n.* [NL. (Linnaeus, 1753), so called from the resemblance of its corolla to a mask; *< L. mimulus*, a little mime, dim. of *L. mimos*; see *mime*.] A genus of scrophulariaceous plants of the tribe *Gratiolæ*, a type of the subtribe *Mimulæ*, characterized by a tubular calyx, which is almost always five-angled or five-toothed, by a two-valved capsule, and by having numerous seeds, with the placenta usually united to form a central column. They are erect or erect, rarely tall, and slightly woody herbs, with opposite undivided leaves, and often showy flowers, which are yellow, orange, red, violet, or rose colored, and solitary in the axils of the leaves, or sometimes racemed at the tips of the branches. The species numbering 45 or 50, are especially numerous in Pacific North America, but are also widely dispersed elsewhere in temperate regions, though not in Europe. Plants of the genus bear the general name of *monkey flowers*. *M. ringens* and *M. albus*, with violet-purple flowers, are common species of wet places in the eastern United States. Various species are cultivated, chiefly in conservatories, some much prized. Among them are *M. moschatellus*, the musk-plant of gardens, strongly musk-scented, the flowers small and pale yellow; *M. cardinalis*, with large scarlet corolla; and *M. albus*, a shrubby, very ornamental conservatory species, the flowers from salmon-colored to scarlet.

A genus of dicotyledonous gamopetalous plants of the natural order Sapotiales and the tribe Bimbleae. It is characterized by having the six or eight segments of the calyx arranged in two series, the outer ones including the inner, which are more slender; the lobes of the corolla entire and three times as many as the calyx segments; and the six or eight stamens, which are alternate with the same number of stamens. They are trees, or rarely shrubs, with a milky juice, and usually small white flowers, which are often fragrant, in axillary clusters. About 30 species are known, found throughout the tropics. Several from India and Ceylon, yield a heavy durable timber, and *M. Elengi* also produces small edible berries, the seeds of which afford an abundance of oil. See *babul-tree*, *bully-tree*, *cow tree*, and *dilly*.

A unit of weight and of value, originally Assyrian, but used also by the Greeks and other ancient peoples. Bronze and stone Babylonian and Assyrian standards show that there were two Assyrian minas, one varying from 360 to 1,040 grams, and the other of half that weight. The Assyrians divided the mina into 60 shekels, and 60 minas made a talent. In Athens at the time of Pericles it was in weight of silver, 100 drachmas, equivalent to 136.3 grams, or 15.4 ounces avoirdupois, or 14 1/2 ounces troy, and was in value about 8 s.

That which feels, wills, and thinks; the conscious subject; the ego; the soul. Some writers make an obscure distinction between mind, soul, and spirit. With them the mind is the direct subject of consciousness.

For to say truly, what els is man but his *mind*? which, whosoever haue skill to compass, and make yielding and flexible, what may not he command the body to performe?  
*Pattenham, Arte of Eng. Poesie, p. 164.*

*Mind*, therefore, is to be understood as the subject of the various internal phenomena of which we are conscious, or that subject of which consciousness is the general phenomenon. Consciousness is, in fact, to the *mind* what extension is to matter or body. Though both are phenomena, yet both are essential qualities; for we can neither conceive *mind* without consciousness, nor body without extension.  
*Sir W. Hamilton, Metaphysics, iv.*

By the *mind* of a man, we understand that in him which thinks, remembers, reasons, wills.

*Sieckenborg, Christian Psychol. (tr. by Gorman), p. 80.*

The idea I have of the human *mind*, in so far as it is a thinking thing, and not extended in length, breadth, and depth, and participating in none of the properties of body, is incomparably more distinct than the idea of any corporeal object.  
*Descartes, Meditations (tr. by Veitch), iv.*

In psychology, on the other hand, the individual *mind* may mean either (i.) the series of feelings, or "mental

phenomena" above referred to; or (ii.) the subject of these feelings, for whom they are phenomena; or (iii.) the subject of these feelings or phenomena + the series of feelings or phenomena themselves, the two being in that relation to each other in which alone the one is subject and the other a series of feelings, phenomena, or objects.  
*J. Ward, Encyc. Brit., XX. 37.*

*Mind* consists of feelings and the relations among feelings.  
*H. Spencer, Data of Ethics, § 41.*

Whatever all men inevitably mean by the word "I" (the empirical ego of philosophy), whenever they say I think, or feel, or intend this or that; and whatever they understand others to mean by using similar language—thus much, and no more, we propose at first to include under the term *mind*.

*J. Sully, Outlines of Psychol., p. 2.*

**Unconscious mind**. See *unconscious*. = *Syn. Mind, Intellect, Soul, Spirit*, reason, sense, brain. Primarily, *mind* is opposed to matter, *intellect* to feeling and will, *soul* to body, and *spirit* to flesh. The old division of the powers of the *mind* was into *intellect*, sensibilities, and will; *mind* is variously used to cover all or some of these, but when less than the whole is meant it is chiefly the *intellect*: as, he seems to have very little *mind*. Yet *mind* is sometimes used with principal reference to the will: as, I have half a *mind* to go. Where *spirit* and *soul* differ, *spirit* applies rather to moral force, and *soul* to depth and largeness of feeling. (See *soul*.) In the New Testament *soul* is used to translate a word covering all life, whether physical or spiritual, as in Mat. x. 28. Upon the highest usage in the Scriptures is founded the common representation of man as immortal by the word *soul*. Hence *soul* is used for the central, essential, or life-giving part of anything: as, he was the *soul* of the party. The definitions under each of these words should be studied to get its range and idiomatic uses. See *reason*.

In defs. 3, etc., merely poss. (adj.), *< ME. min, myn, mine, myne, < AS. mīn*, etc., = Goth. *mīns*, mine, my; from the genitive. Hence, by loss of the final consonant, *my*.] 1. Of me; me; the original genitive (objective) of *I*. It was formerly used with some verbs where later usage requires *me*.

*Morte Arthure (L. E. T. S.), I. 3313.*

2. Of me; belonging to me. The independent possessive form of the first personal *me*, corresponding to *my* as attributive before the thing possessed; as, that (the thing spoken of or indicated) is *mine* (is of me, belongs to me, or is my thing); these books are all *mine* (my property); in this use now virtually an elliptical use of *mine* in def. 3.

My doctrine is not *mine* [of me], but his [of him] that sent me.

*John vii. 16.*

3. Belonging to me; merely possessive, and construed as an adjective, preceding its noun, which may, however, be omitted. When the noun is expressed, the form is in ordinary use now reduced to *my*, the older form *mine* being rarely used except archaically before a vowel or *h*, or by a familiar transposition after the noun, as in sister *mine*, baby *mine*, etc.

Upon a wretch whose natural gifts were poor

To those of *mine*.

*Shak., Hamlet, i. 5. 52.*

By ellipsis, the possessive *mine* is used (like other possessives)—(1) To avoid repetition of the name of the thing possessed; as, your hand is stronger than *mine* (my hand).

**mine**<sup>2</sup> (mīn), *n.* [*ME. mine, myne* = *D. mijn* = *G. Dan. min* = *Sw. mina*, < *F. mine* = *Sp. Pg. It. mina*, < *ML. mina*, a mine, < *minare*, open a mine, lead from place to place; see *mine*<sup>1</sup>, *v.*] 1. An excavation in the earth made for the purpose of getting metals, ores, or coal. Mine-work, in metal mines, consists in sinking shafts and winzes, running levels, and stoping out the contents of the vein thus made ready for removal. In coal-mining the operations differ in detail from those carried on in connection with metal mines, but are the same in principle. The details vary in coal-mining with the position and thickness of the beds. A mine differs from a quarry in that the latter is usually open to the day; but in any mine a part of the excavations may be an openwork (see that word), as in running an adit-level, which may be carried to a considerable distance before becoming covered by earth or rock. When the term *mine* is used it is generally understood that the excavation so named is in actual course of exploitation; otherwise some qualifying term like *abandoned* is required. No occurrence of ore is designated as a mine unless something has been done to develop it by actual mining operations. There are certain excavations which are called neither mines nor quarries, as, for instance, places where clay is being dug out for bricks; such places are frequently (especially in England) called *pits*, and also *openworks*. With few and not easily specified exceptions, a quarry is a place where building-stone, or building-materials of any kind (as lime, cement, etc.), are being got; a mine, where some metal or metalliferous ore is in the process of exploitation. In English the term *mine* includes excavations designated by the French as *mines*, as well as some of those called by them *minières*; quarry is the equivalent of the French *carrière*. The term *mine* is sometimes extended in use to include the ores as well as the excavation.

And alle be it that men fynden gode Dyamandes in Ynde, zit natheles men fynden hem more commonly upon the Roches in the See, and upon Billes where the *Myne* of Gold is.  
Maunder, Travels, p. 158.

Shak., T. of the S., i. 2. 92.

2. *Milit.*: (a) A subterranean gallery or passage dug under the wall or rampart of a fortification, for the lodgment of a quantity of powder or other explosive to be used in blowing up the works. (b) Such an excavation when charged with an explosive, or the charge of explosive

used in such a mine, or sunk under water in operations of naval defense to serve a similar purpose to mines on land. The radius of explosion of such a mine is the straight line drawn from the center of the charge of a mine to the edge of the crater; the radius of rupture is the distance from the center to the curved surface to which the disturbance caused by the explosion extends.

Thus, with Cleveland ironstone containing after calcination some 40 per cent. of iron, about 11 cwt. of limestone are usually requisite per ton of pig iron, or about 22 per cent. of the weight of mine used.

**Common mine** (*mīl*), a mine in which the radius of the crater, or circular opening produced by the explosion, is equal to the line of least resistance—that is, the shortest line from the center of the charge to the surface of the ground.—**Electrical mine**, a charge or series of charges of explosive used for mining and exploded by electricity; a submerged torpedo which can be exploded electrically from a distant point.

**Electrical mines** have the advantage over mechanical that by the removal of the firing battery the passage of a ship is rendered perfectly safe, and that the condition of the mine can be ascertained by electrical tests; but the electric cables are liable to damage, and add greatly to the expense of the defence.  
Encyc. Brit., XIII. 449.

**Electro-mechanical mine**, a submarine mine or torpedo, usually sunk and anchored a short distance below the surface, containing a voltaic battery and a circuit-closer which can be operated by the blow the torpedo receives from a passing ship.

**Electro-mechanical mines** can be made by placing a voltaic battery inside the mine itself and joining it up to fuse and circuit-closer, the circuit-closer completing the circuit when the mine is struck.  
Encyc. Brit., XIII. 450.

A mineral is in almost every case a solid body, and, if it has been formed under suitable conditions, it has, besides its definite chemical composition, a definite molecular structure, which is exhibited externally in its crystalline form and also internally in its cleavage, its behavior with respect to light (optical properties), heat-propagation, electricity, etc. Furthermore, it has other characters, which may belong to it even when amorphous (though sometimes modified by crystallization), as specific gravity, hardness, fracture, tenacity, luster, color, fusibility, etc. A certain variation in physical characters is consistent with the identity of a mineral species, but if the same substance, as calcium carbonate in calcite and in aragonite, occurs in two or more groups of crystals which cannot be referred to the same fundamental form, each is ranked as a distinct species. A difference in specific gravity and in some other physical characters usually accompanies the difference in crystallization. How great a variation in chemical composition, as by isomorphous replacement, is consistent with the identity of a single mineral species is a point about which opinion differs: some authors treat the garnets (all of which have the same form and the same general formula) as a group of related species, and others as varieties of a single species. Chemical compounds formed in the laboratory or in the arts are not regarded as minerals; but where such compounds are already known as occurring in nature are thus formed they are usually called *artificial minerals*. Much attention has been devoted of recent years to the artificial reproduction of minerals, but almost solely as a matter of scientific interest, and as throwing light on the processes of nature.

**mineralization** (min'e-ral-i-zā'shon), *n.* [= *F. minéralisation = Sp. mineralización = Pg. mineralização = It. mineralizzazione; as mineralize + -ation.*] The act or process of mineralizing; the process of converting or being converted into a mineral, as a metal into an oxids, sulphuret, or other ore. The conversion of vegetable matter into coal is not properly mineralization, although sometimes so called. Proper mineralization of vegetable matter does take place, however, as when wood is converted into coal, or becomes silicified, as very frequently happens under certain conditions. This is commonly and properly called *fossilization* or *petrification*, and more rarely *mineralization*. Also spelled *mineralisation*.

Some phenomena seem to imply that the *mineralization* must proceed with considerable rapidity, for stems of a soft and succulent character, and of a most perishable nature, are preserved in flint.

*Lyell, Elements of Geology, I. 92.*

**mineralize** (min'e-ral-iz), *v.*: pret. and pp. *mineralized*, pp. *mineralizing*. [= *F. minéraliser = Sp. Pg. mineralizar = It. mineralizzare; as mineral + -ize.*] **I. trans.** To change from the metallic character to that of an ore. Thus tin, a white metal, becomes very dark-colored and unmetallic in appearance when *mineralized* by oxygen, as it is in the common ore of that metal.

**II. intrans.** To go on a mineralogical excursion; make an excursion with the view of collecting minerals.

Also spelled *mineralise*.

**mineralizer** (min'e-ral-i-zēr), *n.* A substance or agent that mineralizes; a substance that combines with a metal to form an ore. The principal mineralizer is sulphur, and combinations of the metals with this substance form the most common ores, especially at some depth below the surface. Near the surface the sulphureted ores are usually found to have been changed to oxids and carbonates. Some metals (as tin) are almost exclusively mineralized by oxygen; others (as iron) are extensively mineralized by both oxygen and sulphur. Arsenic, antimony, and chlorin are other important mineralizers. Some metals (as silver) exist in combinations containing sulphur, arsenic, and antimony, all combined with the metal to form one mineral species. Also spelled *mineraliser*.

Silver, tin, copper, lead, zinc, and iron are obtained almost exclusively in the form of ores—that is, in combination with a *mineralizer*, of which the most common one is sulphur.

*Mass Edgeworth, Ennui, xi.*

**mineralogy** (min'e-ral-ō-jī), *n.* [*< F. minéralogie (> Sp. mineralogía = Pg. It. mineralogia), for \*mineralogic, < mineral, mineral, & Gr. ζῆλος, < ζῆν, speak: see -ology.*] The science which treats of the properties of mineral species (see *mineral*), which teaches how to characterize, distinguish, and classify them, and which investigates their occurrence in nature with reference to their mode of formation (paragenesis) and the alteration which they may have undergone. Menerva, Etruscan Menerva; prob., with formative -ra, < \*menas- = Gr. μένος, mind, spirit, force, etc., < √ men-, think, as found in ment(-)s, mind, memento, remember, etc.: see mind', n.*] In *Rom. myth.*, one of the three chief divinities, the other two being Jupiter and Juno. The chief seat of the cult of all three was the great temple on the Capitoline Hill. Minerva was a virgin, the daughter of Jupiter, the supreme god, and hence was identified, as the Romans came more and more under the influence of Hellenic culture, with the Greek Athene (or Athena), or Pallas, the goddess of wisdom, of war, and of the liberal arts. Like Athene, Minerva was represented in art with a grave and majestic countenance, armed with helmet, shield, and spear, and wearing long full drapery, and on her breast the grææ. See *cut under Athene*.—**Bird of Minerva**, the owl.—**Minerva Press**, a printing press formerly in Leadenhall Street, London; also, a class of ultra-sentimental novels, remarkable for their intricate plots, published from about 1790 to 1810 at this press, and other productions of similar character.

3. In *politics*: (a) One of the persons appointed by the sovereign or chief magistrate of a country as the responsible heads of the different departments of the government; a minister of state; as, the *minister* of foreign affairs, of the interior, of finance, of war, of justice, etc. These officers constitute the *ministry* or executive department of the government; at their head is the *prime* (first) *minister*, or *premier*, the immediate deputy or representative of the sovereign or chief magistrate; he and other ministers, selected by him, are called collectively, as his coordinate advisers in matters of policy, the *cabinet*. *Minister* is used in most European countries as the official title of all heads of departments, but in Great Britain only in a generic sense (as, a *minister* of the crown), the individual ministers being officially designated the secretary of state for foreign affairs, for war, for the colonies, etc., or by other titles, as chancellor of the exchequer (minister of finance). In the government of the United States the title *minister* is not used at all, and there is no ministry; the corresponding officers, differing from the preceding both in mode of appointment and degree of power and responsibility, are called secretaries of state, of the interior, of the treasury, of war, of the navy, of agriculture, post-master-general, and attorney-general. See *cabinet*, 4.

(b) A diplomatic representative of a country abroad; a person accredited by the executive authority of one country to that of another as its agent for communication and the transaction of business between the two governments; specifically, the political representative of a state in another state, in contradistinction to an ambassador, who holds a nominally higher rank as in general the personal representative of the sovereign or chief of the state at the court of another sovereign. The United States heretofore have sent and received only ministers in this specific sense, called in full either *envoys extraordinary* and *ministers plenipotentiary* or *ministers resident*.

We [the United States] have no ambassadors, we have comparatively few *envoys extraordinary* and *ministers plenipotentiary*, but seem to prefer *ministers resident*.

4. *Ecclies.*, in the New Testament, a servant of God, God's word, Christ, or the church; an officer of the church; an attendant or assistant (Acts xiii. 5); translating *διάκονος* (whence *deacon*), but sometimes *επισκοπος* (liturgy) or *εργαζόμενος* (an assistant); hence, any member of the ministry. The word is used of civil authorities in Rom. xiii. 4-6. In the ancient church *minister* usually meant a deacon or one in minor orders, the Latin word *minister* being the equivalent of the Greek *διακονος*. See *ministry*.

The mink belongs to the same genus as the stoats and weasels, but to a different subgenus, its form being modified in adaptation to its aquatic habits, in which respect it approaches the otter. It was once called *Lesser Otter*. It is larger and stouter than a weasel, with shorter ears, uniformly bushy tail, and light webbed feet; the color is rich dark chestnut-brown, blackening

on the back and tail; the chin, and usually some irregular patches on the throat, breast, or belly, are white. It is 15 to 18 inches long, the tail 8 inches more. It is found everywhere in North America in suitable places; its fur

is valuable, and the animal is systematically trapped, especially in British America. Like its relatives, the mink exhales a strong musky odor, and is destructive to poultry. It has been tamed and bred in menageries, like the ferret. The little black or mountain mink, described by Audubon and Bachman as a distinct species, *P. nigrescens*, is a small dark variety. The corresponding animal in Europe is *P. lutreola*, commonly called *neze* or *neze* and by its Swedish name *mink* (sometimes *munk*), the designation *European mink* being a late book name. It is much like the American mink, but its average size is smaller, and it usually has the upper lip as well as the chin white, and presents certain dental peculiarities. This custom was sanctioned by the church, the saints being substituted for the gods, and was especially consecrated to St. John the Evangelist and to St. Gertrude. Traces of it are still found in certain localities of Germany.

*Minne-drinking*, even as a religious rite, apparently exists to this day in some parts of Germany. At Ottergen, a village of Hildesheim, on Dec. 27 every year a chalice of wine is hallowed by the priest, and handed to the congregation in the church to drink as *Johannis seggen* (blessing). *Grimm, Teut. 4. In *music*: (a) Of intervals, less; shorter; smaller (as compared with major intervals). The word is more often applied to seconds, thirds, sixths, sevenths, ninths, etc., designating an interval equal to the corresponding major interval less one half-step. It has also been applied of late to fourths, fifths, and eighths, and is then equivalent to the older term *diminished*. Finally, it is used to designate the smaller of two intervals that differ by a minute quantity, as a minor tone (10:9), which is a comma less than a major tone: opposed to *major*. See *interval*, 5. (b) Of tonalities and scales, characterized by a minor third and also usually by a minor sixth, and often a minor seventh: opposed to *major*. See *key, tonality, scale*. II. *n.* 1. A person of either sex who is under age; one who is of less than the legal age for the performance of certain acts; one under the authority of parents or guardians, because of not having reached the age at which the law permits one to make contracts and manage one's own property; an infant in the legal sense. In Scots law, *minor*, when used in contradistinction to *pupil* signifies a person above the age of pupilarity (twelve in females and fourteen in males) and under that of majority, which in both sexes is twenty-one years. The technical term in English and United States law for one under the age of legal capacity (twenty-one years) is *infant*, but *minor* is used in the same sense in general literature. Compare *age*, *n.*, 3.

He was confined in the Cretan labyrinth and fed with human flesh, devoured the seven youths and seven maidens whom Minos compelled the Athenians to send him periodically as tribute, and was killed by the hero Theseus, a member of the last company so sent, who escaped from the labyrinth by the aid of Ariadne, daughter of Minos. Hence, in modern literature, the name is used to characterize any devouring or destroying agency of which the action is in some way comparable to that attributed to the Cretan monster.

Cf. *ML. ministerialis* in same sense, < *ministerium*, service: see *ministerium*.] 1. A musician, especially one who sings or recites to the accompaniment of instruments. Specifically, in the middle ages, the minstrels were a class who devoted themselves to the amusement of the great in castle or camp by singing ballads or songs of love and war, sometimes of their own composition, with accompaniment on the harp, lute, or other instrument, together with suitable mimicry and action, and also by story-telling, etc. The intermediate class of professional musicians from which the later minstrels sprang appeared in France as early as the eighth century, and was by the Norman conquest introduced into England, where it was assimilated with the Anglo-Saxon gleemen. Every-where the social importance of the minstrels slowly degenerated, until in the fifteenth century they had formed themselves generally into guilds of itinerant popular musicians and mountebanks. In England they fell so low in esteem that in 1557 they were classed by a statute with rogues, vagabonds, and sturdy beggars; but in France their guilds were maintained until the revolution. See *gleeman*, *troubadour*, *trouvère*, and *jongleur*.

W. Ward, Eng. Dram. Lit.*, I. 13.

Originally, one of a class of singers of negro melodies and delineators of life on the Southern plantations which originated in the United States about 1830: called *negro minstrels*, although they are usually white men whose faces and hands are blackened with burnt cork. The characteristic feature of such a troupe or band is the middle man or interlocutor, who leads the talk and gives the cues, and the two end-men, who usually perform on the tambourine and the bones; and between whom the indispensable conundrums and jokes are ex-

changed. As now constituted, a negro minstrel troupe retains but little of its original character except the black faces and the old jokes.

The United States Mint was established by act of April 24, 1793, and located at Philadelphia. Other mints have since been established at San Francisco, New Orleans, Carson City, and Denver (but the last two are, properly speaking, assay offices). The United States Mint is a bureau of the treasury Department, under the charge of an officer called the Director of the Mint.

A slow and graceful dance, invented, probably in Poitou, France, about the middle of the seventeenth century. Throughout the eighteenth century it was the most popular of the more stately and ceremonious dances.—2. Music for such a dance, or in its rhythm, which is triple and slow. Minuets are frequently found in the old suite, and also in the later sonata and symphony. They properly consist of two contrasted sections of sixteen measures each, the second of which is generally called a *trio*, because originally written for but three instruments; but this regular form is often considerably modified. Beethoven was the first to replace the minuet in the sonata and the symphony by the *scherzo*, which resembled the minuet somewhat in rhythm, but was more sprightly and unrestricted in form and spirit.

In algebra and arithmetic this sense is indicated by the sign —, called the minus sign or sign of subtraction; as,  $a - b = x$ , which is read "a minus b equals x"; 25 — 9 = 16.

2. Less than nothing; belonging to the inverse or negative side, as of an account; lying in the direction from the origin of measurement opposite to ordinary quantities; below zero, or below the lowest point of positive or upward reckoning; as, a *minus* amount or sum (that is, an amount or sum representing loss or debt); a *minus* quantity in an equation (that is, one having the minus sign before it); the tempera-

ture was *minus* twenty degrees (written — 20°, and read "twenty degrees below zero"). In some common mathematical phrases, *minus* seems to be used as an adverb modifying the numeral adjective. Thus astronomers speak of the year *minus* 584 of the Christian era, meaning 585 B. C.

3. Marking or yielding less than nothing or less than zero; negative in value or result; as, the *minus* sign (see *def.* 1).—4. *Isaac Taylor, The Alphabet*, I. 71

II. *n.* The kind of reduced alphabetical character which, originating in the seventh century, was from about the ninth substituted in writing for the large uncial previously in use, and from which the small letter of modern Greek and Roman alphabets was derived; hence, a small or lower-case letter in writing or printing, as distinguished from a capital or majuscule.

The *minuscule* arose in the 7th century as a cursive monastic script, more legible than the old cursive, and more rapidly written than the uncial, and constructed by a combination of the elements of both.

*Isaac Taylor, The Alphabet*, II. 160.

The period of the uncials runs from the date of the earliest specimens on papyrus to the 9th century, that of the *minuscule* from the 9th century to the invention of printing.

These subdivisions were translated into Latin as *partes minute primæ* and *partes minute secundæ*, whence our minutes (primes) and seconds. In modern astronomical works minutes of time are denoted by the initial letter *m*, and minutes of a degree or of angular space by an acute accent ('). See *degree*, 8.

and the hot shining of the sun seems to be an invari-

able antecedent. The mirage of the desert presents an  
appearance of objects reflected in a surface of water; in  
this case the heated earth rarefies the air in the lower  
strata faster than it can escape, and the flatness of the  
ground conduces to the maintenance of the resulting ab-  
normal distribution of density. Displacement by mirage  
is commonly vertical, but is lateral when the density-gradi-

ent is more or less inclined to the vertical. Looming and  
fata Morgana are species of mirage. See these words.

= **Syn. 2.** *Mischance, Mishap, Misfortune, Disaster, Calamity, Catastrophe, misadventure, ill, harm, reverse, blow, stroke, trouble.* The first six words are arranged in the order of strength; they agree in denoting untoward events, produced by causes presumably independent of the sufferer. *Mischance* is the lightest word for that which is really disagreeable; a *mishap* may be comparatively a trivial thing; both generally apply to the experience of individuals. *Misfortune* is the most general of these words; a *misfortune* is a really serious matter; it may befall a person, family, or nation. A very serious misfortune affecting large numbers is a *calamity*, the central idea of which is wide-spread and general mischief. A *disaster* is not necessarily wide-spread; it is generally sudden, and its importance is in its effects upon other interests, as marring or ruining particular plans, hopes, courses, or conditions of things. A *disaster* may befall an individual; a *calamity* can come to an individual only by affecting his welfare largely or bringing him into deep distress. A *catastrophe* is strictly a great misfortune bringing things to an end, a final crash, a finishing stroke; as, this brought on the *catastrophe*. See *affliction*.

**Mishnah** (mish'nä), *n.* [*Also Mishna; Heb. mishnah, repetition, explanation; < shanah, repeat.*] 1. In *Jewish lit.*, a collection of halachoth or binding precepts and legal decisions deduced by the ancient rabbis from the Pentateuch, and itself forming a second or oral law. See *halachah*. These halachoth, which had been preserved for several centuries by tradition among the doctors of the synagogue, were gradually committed to writing. The first who attempted to reduce them to order was Hillel I. (b. c. 75–A. D. 10), president of the Sanhedrim, who arranged them in six *Sedarim* or orders. The final redaction, however, was made by Rabbi Jehudah, surnamed "the holy," about the end of the second century of our era. The *Mishnah* is divided into six parts, each of which contains a number of treatises, which are subdivided into chapters, and these again into paragraphs or *mishnoth*. The first part relates to agriculture; the second regulates the manner of observing festivals; the third treats of women and matrimonial cases, the fourth of damages and

losses in trade, etc.; the fifth is on "holy things" — that is, oblations, sacrifices, etc., and the sixth treats of the several sorts of purification. The *Mishnah* forms the text on which the *Gemara* is based. See *Gemara* and *Talmud*.

The *Mishnah* consists chiefly of Halakhab; there is, comparatively speaking, little *Agadah* to be found in it. It is not, however, as many think either a commentary on the Halakhe portions of the Pentateuch, or on the ordinances of the Sopherim, or on both together. It rather presupposes the knowledge of and respect for both the Mosiac and the Sopheric laws, and it only discusses, and finally decides on, the best mode and manner of executing these.

Cf. also def. 3. See *mistress*, *Mrs.*] 1. Mistress: a reduced form of this title, which, so reduced, came to be regarded, when prefixed to the name of a young woman or girl, as a sort of diminutive, and was especially applied to young girls (corresponding to *master* as applied to young boys), older unmarried girls or women being styled *mistress* even in the lifetime of the mother; later, and in present use, a title prefixed to the name of any unmarried woman or girl. In a restricted use, the title *Miss*, with the surname only, now distinguishes the eldest daughter of a family, the younger daughters having the title *Miss* prefixed to their full name; as, *Miss Brown*, *Miss Mary Brown*, etc. Some unmarried women, holding independent positions as house-holders or otherwise, are still styled *Mistress* (*Mrs.*) as a mark of special respect, at least in some parts of the United States. In speaking or writing of two or more persons of the same name by the title of *Miss*, the plural form is often given to the name as a whole, as the *Miss Smiths*, instead of to the title, as the *Misses Smith*.

II. *n.* In the *Rom. Cath. Ch.*, the book containing all the liturgical forms necessary for celebrating mass throughout the year. origi-

nally the ordinary, canon, and some other parts of the mass were contained in the sacramentary, which also included the offices for the other sacraments. In addition to this the antiphony, lectionary, and evangeliary had to be used. Early in the eighth century the name of *missal* (*missalis* (sc. *liber*), *missale*) came to be applied to the sacramentary, and later to books containing additional parts of the mass. A book like the modern missal, containing all the forms of the mass, was called a *plenary missal* (*missale plenarium*). The modern Roman missal (the "reformed missal") was issued substantially in its present form under Pius V. in 1570, and revised again under Clement VIII. and Urban VIII. It is the only Latin missal allowed to be used in the Roman Catholic Church, with the exception of the limited local use of the Ambrosian, Mozarabic, and some monastic rites. Roman Catholic priests in England do not follow the Sarum and other ancient English uses, but the present Roman rite. The Uniate and other Latinizing communities in Oriental countries are allowed to retain their ancient offices, with alterations more or less considerable. In the Roman missal, after the introductory matter (calendar, general rubrics, etc.) come the introits, collects, epistles, gospels, graduals, offertoria, secrets, communions, postcommunions, etc., throughout the year. The ordinary and canon of the mass are placed in the middle of the book, between the proper of Holy Saturday and that of Easter Sunday. After these masses de tempore follow the common of saints, votive and special masses, etc., and masses allowed to be used in special places. The *euchologion* of the Greek Church answers not to the missal, but to the original sacramentary.

The sacramentary became subdivided into the full mass-book or *missal* properly so named.

It is found on a great variety of trees, especially the apple-tree, but seldom on the oak. The mistletoe (compare def 2) was consecrated to religious purposes by the ancient Celtic nations of Europe, and was held in peculiar veneration by the Druids, especially when found growing on the oak. Traces of this old superstitions regard for the mistletoe still survive in European countries, as in the custom of kissing under it at Christmas. It was formerly highly esteemed as an antispasmodic, but is not now so used. It seems, however, to have some pharmacodynamic properties.

Mites once formed a comprehensive genus *Acarus* or family *Acaridae*, terms not yet obsolete; but with the introduction of many more genera, the establishment of several families, and the elevation of the group to the rank of an order, a more elaborate nomenclature has been established, in which neither *Acarus* nor *Acaridae* is retained. (See *Acarida*.) Adult mites are eight-legged like most arachnids; but some six-legged immature forms at one time constituted a supposed genus *Leptus*. (See *Leptus*, and cut under *harvest-tick*.) The species of mites are very numerous, diversified in form, and various in habits. Many are parasitic; others are terrestrial or aquatic; others live in cheese, flour, sugar, etc. *Mite* is consequently much used in composition. The cheese-mite or flour-mite is *Tyrophagus caseorum* or *T. longior*; the sugar-mite is *Glyciphagus prunorum*, or another of the same genus. Such mites compose the family *Tyrophagidae*, and are among those longer known as species of *Acarus* or *Acaridae*. Itch-mites are *Sarcoptidae*, as *Sarcoptes scabiei*. (See cut under *itch mite*.) Mange-mites are *Demodicidae*; garden-mites or harvest-mites, *Trombididae*; spinning mites, *Tetranychidae*; beetle-mites or wood-mites, *Oribatidae*; spider-mites, *Gamasidae*; water-mites, *Hydrachnidae*; snout mites, *Bdelloidae*; gall mites, *Phytoptidae*. Certain mites, the *Lepididae*, are commonly distinguished as ticks, as *Ixodes ricinus* (see cut under *Acarida*), and those of the family *Trombididae* are indifferently called *harvest mites*, *harvest ticks*, *harvest-bugs*, *red-bugs*, and by other names. See the compound and technical names.

A form of head-dress anciently worn by the inhabitants of Lydia, Phrygia, and other parts of Asia Minor.—2. A sacerdotal head-dress, as that worn by the ancient Jewish high priest, or that worn by a bishop. The Jewish miter was made of linen, and wrapped in folds about the head, like a turban. Before the fourteenth century the miter in the Christian church was low and simple; but now it consists of a coronet, surmounted by a lofty and deeply cleft cap. The privilege of wearing the miter in the Roman Catholic Church was a concession of the popes, and was formerly exercised by cardinals and the higher dignitaries. Bishops and abbots (if to be mitered) receive the miter from the consecrating bishop. Three kinds of miters are distinguished: (1) the precious miter, made of gold or silver plate and adorned with jewels; (2) the auriphrigate miter; and (3) the simple miter of white silk or linen. The bishops of the Church of England wore miters as late as the coronation of George III., and some Anglican bishops occasionally wear them at the present day. The piece of wood to be mitred is laid in the box, and the saw, being worked through the guide-cuts in the vertical sides, cuts the wood to the necessary angle. (See *miter-joint*.) Another form consists of a bed and a fence, against which the work rests, and an adjustable guide for the saw, so that it admits of cutting at any required angle. In printing the name is given to a square channel of wood or iron having diagonal cuts in the sides, in which a saw can move freely in cutting pieces of wood or brass of uniform angles.

One form of this machine consists of a table with a circular saw and adjustable guides or fences; another consists of a bed and guide, with two blades at right angles, for making a downward cut, fixed at an angle of 45 to the guide and actuated by a lever. The latter form is used for mitring picture-frames and small moldings.

When the angle formed by the junction of two parts is 45°, and the plane of division bisects this angle, the joint is sometimes called a *half miter-joint*. Also called *miter*.

The shafts of the wheels are at right angles with each other; and rotary motion in any plane is, by this mechanism, translated, without change of velocity, into motion in another plane at right angles with the first. Miter-wheels are much used in mill-work. See *bevel-wheel* and *bevel-gear*.

4. In *chem.*, a blending of several ingredients without chemical alteration of the substances, each of which still retains its own nature and properties; distinguished from *combination*, in which the substances unite by chemical attraction, lose their distinct properties, and form a compound differing in its properties from any of the ingredients.—5. In *organ-building*, a flue-stop having two or more pipes to each digital, the pipes being so tuned as to give certain sets of the shriller harmonies of the fundamental tone of the digital; a compound stop. The stop is known as "of two ranks," "of three ranks," etc., according to the number of pipes to a digital. The harmonies chosen for reinforcement vary with the pitch of the fundamental tone, a low tone being provided with higher harmonies than a high one. The points in the compass where changes from one set of harmonies to another take place are called *breaks*. The harmonies usually chosen are those that lie at the intervals of fifths or octaves from the fundamental tone, rarely at those of thirds or sevenths. Mixtures serve two purposes: to enrich the total effect of heavy combinations by reinforcing the brilliant overtones of the harmony, and to emphasize the upper tones of heavy chords by reinforcing their nearer harmonies. They are never properly used except in combination with foundation-stops. Mixtures are variously named, as *cornet*, *cur-nature*, etc.

**Rule of mixtures**. Same as *alligation*, 2. = *Syn. 2. Mixture*, *Miscellany*, *Medley*, *Farrago*, *Hotch-potch*, *Jumble*; variety, diversity. *Mixture* is a general term denoting a compound of two or more ingredients, more often, but not necessarily, cognous. *Miscellany* is a collection of things not closely connected, but brought together by rational design: "A *miscellany* has the diversity without the incongruity of a *medley*." (*C. J. Smith, Syn. Disc.*, p. 564.) Specifically, a *miscellany* is a collection of independent literary pieces, the unity lying only in their general character. A *medley* is a mixture or collection of things distinctly incongruous; the word has the specific sense of a song or tune made up of scraps of other songs or tunes ingeniously and amusingly fitted together. *Farrago* emphasizes the confusion or indiscriminateness of the mixture or collection. It is applied chiefly to printed or spoken discourse. *Hotch-potch* is a still more energetic expression of the confusion of the collection, the idea being drawn from the boiling together of shreds of all sorts of food. *Jumble* implies the idea of a heap turned over and over till everything is hopelessly mixed. The figurative uses correspond essentially to the literal.

4. The natural disposition or the manner of existence or action of anything; a form; as:

heat is a *mode* of motion; reflection is a *mode* of consciousness.

There is something in things which neither is the thing itself, nor another thing, nor yet nothing, but a certain medium between them both. And thus used to be called a *mode*; for example, a degree of quality is not quality, not yet is it wholly nothing, but a *mode*.

Burgesheims, tr. by a Gentleman.

A *mode* is the manner of existence of a thing. Take, for example, a piece of wax. The wax may be round or square or of any other definite figure; it may also be solid or fluid. Its existence in any of these *modes* is not essential; it may change from one to another without any substantial alteration. As the *mode* cannot exist without a substance, we can accord to it only a secondary or precarious existence in relation to the substance, to which we accord the privilege of existing by itself, per se existence; but though the substance be not ascribed to any particular *mode* of existence, we must not suppose that it can exist, or at least be conceived by us to exist, in none. All *modes* are therefore variable states; and though some *mode* is necessary for the existence of a thing, any individual *mode* is accidental. *Sir W. Hamilton*, *Metaph.*, viii.

I am . . . assured that those *modes* of consciousness which I call perceptions and imaginations, in as far only as they are *modes* of consciousness, exist in me.

Descartes, *Meditations* (tr. by Veitch), iii.

5. A combination of ideas. See the quotations.

*Modes* I call such complex ideas, which, however compounded, contain not in them the supposition of subsisting by themselves, but are considered as dependencies on or affections of substances.

Locke, *Human Understanding*, II. xii. 14.

There are some [*modes*] which are only variations or different combinations of the same simple idea, . . . as a dozen, or score; which are nothing but the ideas of so many distinct units added together; and these I call simple *modes*, as being contained within the bounds of one simple idea. *Locke*, *Human Understanding*, II. xii. 5.

Combinations of simple ideas of different kinds I have called 'mixed *modes*.'

Locke, *Human Understanding*, II. xii. 5.

6. In *logic*: (a) A modification or determination of a proposition with reference to possibility and necessity. (b) A variety of syllogism. See *mood* 2, the more usual but less proper form.

Sir T. More, *Works*, p. 504.

(c) The significante of a part of speech. (d)

An accidental determination.—7. In *music*:

(a) A species or form of scale; a method of dividing the interval of the octave for melodic purposes; an arrangement of tones within an octave at certain fixed intervals from each other. Three great systems of modes are to be distinguished—the ancient Greek, the Gregorian, medieval, or ecclesiastical, and the modern. These three were successively derived from each other, but with noteworthy changes of both principle and nomenclature. (b) In the Greek system each mode consisted of two tetrachords (two whole steps and one half-step in each) plus one whole step (the diatonic tone). The nature and the name of the mode varied according to the tetrachord used as a basis and according to the position of the diatonic tone, or, in other words, according to the relative order of the whole steps and half-steps. When the diatonic tone lay between the two component tetrachords, the mode was named simply from the tetrachord used—the mode containing Porian tetrachords was called *Porian* or *Porie*, etc., but when it lay below or above both of them, the prefixes *hypo-* and *hyper-* respectively were added, as *Hypoporphorian*, *Hyperporphorian*, etc. Below is a table of the nine original modes, reckoned upward, the whole steps being indicated by +, the half-steps by =, the constituent tetrachords by —, and the diatonic tone by +:

I. Dorian,	+ — + — + — + —
II. Phrygian,	+ = — + — + — + —
III. Lydian,	+ — + — + — + —
IV. Hypodorian, or Eolian,	+ — + — + — + —
V. Hypophrygian, Ionian, orastian,	+ = — + — + — + —
VI. Hypolydian,	+ — + — + — + —
VII. Hyperdorian, or Mixolydian,	+ — + — + — + —
VIII. Hyperphrygian, or Locrian,	+ = — + — + — + —
IX. Hyperlydian,	+ — + — + — + —

These modes were embodied in scales of about two octaves, sometimes called *transposition scales*, which were more or less susceptible of transposition. By the later theorists fifteen such scales were recognized, each derived from one of the foregoing modes, and beginning at a different pitch, each a half-step higher than the preceding. These scales, though not always differing from each other in mode, but only in relative pitch, were also called *octaves*, and were named like the modes themselves. Assuming the lowest

2. To change the properties, form, or function of; give a new form to; alter slightly or not very much; vary: as, to *modify* the terms of a contract; a prefix *modifies* the sense of a word; light is *modified* by its transmission through certain media. In crystallography one crystalline form is said to *modify* another when the two occur together in the same crystal, the modified form predominating; thus, the cube may be *modified* by the trapezohedron. A highly modified crystal is one showing a large number of different crystalline forms.

*Newton, Opticks.*

*Modify* implies the continued existence of the subject-matter to be *modified*, but with some change or qualification in form or qualities without touching the mode of creation. It implies no power to create or bring into existence, but only the power to change or vary in some particular an already created or existing thing.

*Stade & Lawrence, 12 Oreg. 297.*

Thus I can understand how a flower and a bee might slowly become, either simultaneously or one after the other, *modified* and adapted to each other in the most perfect manner, by the continued preservation of all the individuals which presented slight deviations of structure mutually favorable to each other.

2. A state or condition reached by a process of modulating, modifying, or varying.

C. C. Perkins, *Italian Sculpture*, p. 124.

3. (*a*) In *Gregorian music*, one of the tones in a mode with which every phrase of a melody in that mode must begin and end. The regular modulations of each mode include the final, the dominant, the mediant, and the participant, each of which has its own peculiar functions. (See these words, and also *model*.) To these are added two other tones in each mode, called *concorded modulations*, which are of minor importance. (*b*) In *mod. music*, the act, process, or result of changing, in the course of a piece, from one key (tonality) to another, so that a new tone becomes the key-note and the relative significance of all the tones common to both tonalities is altered. When a tone foreign to the original tonality of a piece is used, a modulatory effect is nearly always produced. If this effect is carried out into a cadence in the new key, the modulation is called *final*; otherwise it is *passing* or *transient*. All modulations, however, require a return to the original key before the end of the piece. The tone by which the transition is introduced or effected is called the *note of modulation*; this tone in the simpler forms of modulation is usually the fourth or the seventh tone of the new key. The simplicity of a modulation depends upon the closeness of relationship between the keys involved. The simplest modulations are into the keys either of the dominant or of the subdominant, and are effected by sharpening the fourth tone or flattening the seventh tone respectively of the original key. Modulations into the relative minor or into the minor keys of the supertonic or of the mediant are effected by sharpening the fifth, the first, or the second tone of the original key respectively. Numerous other more intricate modulations are possible, especially in instrumental music. A modulation is *abrupt*, *distinct*, or *extenuous*, when it leads into a key not closely related with the original one. It is *deceptive* when it utilizes a series of chords in an unusual and startling way. It is *melodic* when produced by the introduction of a tone foreign to the original tonality, and *harmonic* when produced by the use of a chord common to both tonalities first in its relation to one and then in that to the other. It is *enharmonic* when it is effected on an instrument of fixed intonation, like the pianoforte, by calling a key (digital) first by one name and then by another, as when E<sub>4</sub> in the key of E<sub>3</sub> is called D<sub>5</sub> in the key of E<sub>2</sub>. Modulation is one of the most important resources of modern music. It introduces endless variety of both melodic and harmonic effect, with great possibilities in the way of sequences and imitations. It increases the unity of a composition and the importance of the original tonality by introducing a temporary disturbance of original tonal relations, with a subsequent complete and emphatic resumption of them. It affords means for the expression of very complex emotional conditions, particularly those of unrest, contrast, etc. In the style of Wagner it has often been pushed to the limit of toleration, so as almost to destroy that sense of fixed tonality which is the basis of musical certitude. The most remarkable harmonic convenience for modulation, at least in instrumental music, is a chord of four tones consisting of three minor thirds successively superposed, which is called the *chord of the diminished seventh*. This chord may be regarded as based upon any one of its four tones, which is then the seventh tone of either a major or a minor scale. Its harmonic nature is therefore peculiarly ambiguous and unstable. (*c*) A musical composition exemplifying modulation.—4. Sound modulated; melody.

**module** (mod'ūl), *n.* [*F. module* = Sp. *módulo* = Pg. *It. modulo*, a measure, module, < *L. modulus*, a small measure, a measure, mode, meter, dim. of *modulus*, measure; see *modulus*. Cf. *modulus*, *model*, *model*.] 1. A little measure; hence, a small quantity.—2. In *arch.*, a standard of measure often taken, particularly in antiquity and the middle ages, to regulate the proportions of an order or the disposition of an entire building. In the classical styles the diameter or semidiameter of the column at the base of the shaft is usually selected as the module, and this is subdivided into parts or minutes, the diameter generally into sixty or the semidiameter into thirty. Some architects employ no fixed number of divisions of the module, but divide it into as many parts as they deem serviceable for the work in hand.

The species are inhabitants of tropical seas, and one, *Modulus tectum*, is abundant in the West Indies.

**modulize** (mod'ū-līz), *v. t.* [*F. module* + *-ize*.] To model.

While with the Duke, th' Eternal did devise,  
And to his inward sight did *modulize*  
His Tabernacle's admirable Form.

Sylvester, tr. of Du Bartas's Weeks, ii, The Lawe.

**modulus** (mod'ū-lus), *n.* [*L. modulus*, a measure, dim. of *modus*, measure; see *module*, *modulus*.] 1. In *math.*, a real positive number that serves as measure or parameter of a function or effect. Represented by *M*, or *u*.—2. In *physics*, the measure of an effect under conditions whose measure is unity. Thus, a physical modulus is not a number, but a physical quantity.—3. [*cap.*] In *conch.*, a genus of gastropods, referred to the *Littorinidae* or periwinkles, or made type of the family *Modulidæ*. The shell is depressed and trochiform, with a deeply ent columellar tooth and many-whorled operculum.—4. **Absolute modulus of gravitation**, the acceleration due to the gravitation of a body toward a mass of one gram at a distance of one centimeter. Thus, 23 is congruent to 2, the modulus being 7; and this is written by Gauss and others  $23 \equiv 2 \pmod{7}$ .—**Modulus of a linear transformation**, in *math.*, the square of the determinant of the matrix of transformation—that is, if the transformation takes place according to the equations

$$\begin{aligned}x &= a\xi + b\eta + c\zeta \\y &= d\xi + e\eta + f\zeta \\z &= g\xi + h\eta + i\zeta,\end{aligned}$$

then the modulus of transformation is

$$\begin{vmatrix}a & b & c \\d & e & f \\g & h & i\end{vmatrix}^2$$

**Modulus of a machine**, the ratio of the load to the power in equilibrium. — **Modulus of a matrix**, in *math.*, the determinant of the matrix, this having the same constituents arranged in the same way. — **Modulus of an elliptic integral, differential, or function**, in *math.*, that positive number less than unity the square of which multiplies the square of the sine of the amplitude or variable angle in the delta or square root which enters into the expression of such a quantity. — **Modulus of an imaginary**, in *math.*, that real positive number which multiplied by a root of unity gives the imaginary. — **Modulus of a system of logarithms**, in *math.* See *logarithm*. — **Modulus of elasticity**, in *physics*, in its general sense, the quantity of elasticity or the ratio of a stress to the strain that occasions it; but applied by older and less careful writers to *Young's modulus* [named after its inventor, Dr. Thomas Young, a celebrated English physicist (1773-1829)], which is the pressure or tension on the end of a bar per unit of section divided by the compression or elongation per unit of length so produced. See *elasticity*. — **Modulus of gravitation**, in *astron.*, the square root of the component acceleration due to gravitation of any body toward the sun at a distance equal to the mean distance of the earth. See *absolute modulus*, above. — **Modulus of propulsion**. See the quotation.

As 100 cubic inches of cylinder capacity are needed to move an engine with 20 tons adhesive weight one inch, if we divide 100 by 20 we will get the cylinder capacity needed for each ton. That is,  $100 \div 20 = 5$  cubic in. cylinder capacity per ton (of 2,000 lbs.) of adhesive weight is needed to move any locomotive one inch. This quantity we have named the *modulus of propulsion*.

*Forney, Locomotive*, p. 415.

**Quadratic modulus**, in *math.*, the square of the determinant. — **Young's modulus**. See *modulus of elasticity*, above.

**modus** (mō'dus), *n.* [*L. modus*, manner, mode; see *mode*]. 1. Manner; mode; same as *mode*].

The same evangelical power did institute that calling, for the *modus* of whose election it took such particular order.

*Jer. Taylor, Works* (ed. 1835), II. 164.

2. In *Rom. and civil law*, and *early Eng. law*, the manner or qualifying terms of a gift or disposition of property. The introduction of writing as the instrument of gift or transfer enabled donors to vary the customary legal consequences by expressing an intent as to the manner or mode in which the act should have effect; and that part of the instrument which thus qualified what otherwise would have been the ordinary legal effect was termed the *modus*, and the same term was used to designate the legal qualification thus imposed. Hence, more specifically—(a) The clause in a will or other gift (and the legal obligation created thereby) by which the donor charged an obligation upon the legatee or donee, not as a condition the breach of which would create a forfeiture, but as a personal obligation, which the legatee would assume by accepting the gift. (b) Also, in *early Eng. law*, the clause in a conveyance enlarging or restricting the estate which otherwise would be granted by it, as for instance by giving to the donee and his heirs, or his heirs and assigns, or by giving to the donee and only a specified class of heirs. Hence the old common-law maxims *modus et conventio vincunt legem* and *modus legem dat donationi*, meaning specific qualification and express agreement override the law, or give the law to the transfer. (c) In *eccles. law*, the exemption, or partial exemption, from the payment of tithes, termed *modus decimandi* and *modus non decimandi* respectively.

One terrible circumstance of this bill is turning the tithe of flax and hemp into what the lawyers call a *modus*, or a certain sum in lieu of a tenth part of the product. *Swift*.

A tithe of turf and a tithe of furze had been lately introduced, and certain *moduses*, or compositions, which had elsewhere been substituted for other tithes, were in this province [Munster] unknown.

**2.** Anything cast in a mold, or anything formed as if by a mold.—**3.** In *arch.*, a member of construction or decoration so treated as to introduce varieties of outline or contour in edges or surfaces, whether on projections or in cavities, such as on cornices, string-courses, bases, door- or window-jambes, lintels, etc. In classical architecture moldings are divided into three classes: the *right-lined*, as the fillet, torus, listel, regula; the *curved*, as the astragal or bead, the torus, the cavetto, the quarter-round, ovolo, and echinus; and the *composite*, as the ogee, talon, or cyma reversa, the cyma recta or dentelle, and the scotia or trochilos, all of which are known by many synonymous

names. In Roman architecture all curved moldings are formed of portions of circles, while in Greek architecture they are for the most part formed of some conic section, of which the curve, in good work, is always of extreme refinement. All these moldings are frequently en-

Sections of Medieval Moldings.

riched by carving. In the architecture of the middle ages there is very great diversity in the form and arrangement of the moldings. In the Norman style they consist almost entirely of rounds and hollows, variously combined with splays and fillets, a striking peculiarity of this style being the recurrence of moldings broken into zigzag lines. In the succeeding English style, the early Pointed, the moldings are much lighter and more boldly cut. In the Decorated style of the fourteenth century there is still greater diversity, and this period is further characterized by the introduction of the *roll-molding*, and another termed the *wave-molding*. In the Perpendicular style large and often shallow hollows prevail, and the moldings are in general of flatter profile and less effective than those of earlier periods. The moldings of medieval architecture are very commonly sculptured with surface-ornament beautiful in design and elaborate in workmanship. See cuts under *dog-tooth*, *double cone*, *egg*, *indented*, *keel-molding*, *lozenge*, *trifol*, 3.—**Belt-molding**, a molding passing entirely around the interior of a passenger-car, directly above the windows. *Car-Builders' Dict.*—**Dovetail-molding**. forms an undulating or wavy line; introduced in corbel-tables and archivols.—**Raking molding**, a molding inclined from the horizontal or vertical, as that which often follows the line of a staircase, the rail of an ascending balustrade, etc.

**molding-bed** (môl'ding-bed), *n.* A machine for working rectilinear moldings in marble. A traveling frame carries revolving grinders, and is adjustable vertically by a screw to the height required by the thickness of the marble. The grinders are solid cylinders of cast iron, and are counterparts of the required moldings.

**molding-board** (môl'ding-hôrd), *n.* Same as *mold-board*.

**molding-box** (môl'ding-boks), *n.* In *foundry-work*, a molding-flask.

**molding-crane** (môl'ding-krân), *n.* A crane adapted for use in a foundry in handling molds and flasks; a foundry-crane.

**molding-cutter** (môl'ding-kut' ér), *n.* A tool working on the principle of the plane-iron or enter of a hand-plane, the edge of which is formed by a bevel on one side of the tool. The edges of molding-cutters are formed to correspond with the outline of the cross-sections of the moldings to be cut, each cutter being adapted to only one pattern of molding. Thus, to cut a molding of semicircular cross-section, the edge of the cutter must be a semicircle of the exact size of the molding. Such moldings were formerly cut by hand-planing, but this is now almost entirely superseded by power-planing machines with rotary cutters.

**molding-file** (môl'ding-fil), *n.* A file with a concave face used for finishing molded surfaces.

**molding-flask** (môl'ding-flâsk), *n.* **1.** Same as *flask*, 2.—**2.** In *dentistry*, a jointed receptacle in three parts, in which the vulcanite model and plaster mold are secured in making dentures ready for the muffle. *E. H. Knight.*

**molding-hole** (môl'ding-hôl), *n.* In *foundry-work*, an excavation in the foundry floor in which castings of large size are made.

**molding-loam** (môl'ding-lôm), *n.* A mixture of clay and sand employed by foundrymen in constructing molds for loam-molding.

**molding-machine** (môl'ding-mâ-shên), *n.* **1.** In *wood-working*, one of a class of high-speed power-machines for planing, recessing, shaping, molding, profiling, and paneling wood. Such machines occupy in wood working much the same position as the milling-machine in metal work, as both operate by means of revolving cutters. In molding machines all the work is performed by revolving cutter-heads having variously shaped knives. These cutters are used singly, as in some panel-machines, and project through the table on which the work is laid, or they are arranged in gangs and series so that the wood in passing through the machine is exposed successively to all the cutters. By this gang-system of cutters it is possible to cut moldings and edgings of the most complicated pattern. One form of the machine has the cutters between the cutter-alar bearings, and is known as a *matching machine* or *wood-planing machine*, or an *inside-molding machine*. In another form the cutters project up through the table and are arranged to work upon the inside edges of moldings. This type is known as the *edge-molding machine*. Sometimes called *carving machine*, *carving-planer*, or *relief-paneling machine*.

**2.** A machine for making molding from an artificial composition. The material is forced from a hopper by a compressor, is carried by an apron beneath a die-wheel, and after being shaped by this it is delivered on a table.

**3.** In *sheet-metal working*, a rolling-machine with shaped rollers of which one is the counterpart of the other, for molding sheet-metal into shape for cornices, balusters, etc.—**4.** In *foundry*: (a) A machine for making loam-molds in flasks from small patterns carried by the machine. (b) A gear-molding machine.—**Gear-molding machine**, an apparatus for molding large gear-wheels from a pattern of a small section of the gear, as of two teeth and the interdental space.—**Stone-molding machine**, a machine for working stone moldings. It resembles one form of stone-saw, but differs from it in having the frame which carries the revolving grinder adjustable, by means of a screw beneath, to the thickness of the slab. The grinder is kept constantly supplied with moist sand.—**Surface-molding machine**, a form of molding-machine with double-edged cutters and a rapid reverse motion. It is used to cut scrolls and plain or molded designs on the surface of solid wood, to rout such work as ends of pews and stairs, to form grooves for in-laid work, to make tracings for carving, etc.

**molding-mill** (môl'ding-mil), *n.* A sawmill or shaping-mill for timber.

**molding-plane** (môl'ding-plân), *n.* In *joinery*, a plane used in forming moldings; a *match-plane*. Such planes have various patterns or convex and concave soles for making the different parts of moldings, as hollows and rounds.

**molding-plow** (môl'ding-plou), *n.* A plow with two mold-boards to throw the soil to both sides at once; a *ridging-plow*. It is used in forming ridges, in hilling potatoes, etc.

**molding-sand** (môl'ding-sâd), *n.* A mixture of sand and loam of which molds for use in a foundry are made.

**molding-saw** (môl'ding-sâ), *n.* A circular saw or combination of circular saws for cutting out blocks approximating to the shapes of ornamental moldings. The molding is finished by cutters formed to the exact curve.

**molding-table** (môl'ding-tâ bl), *n.* A table on which a potter molds his ware. It has a trough in which the workman moistens his hands, and a block-and-stock board on which he places the tile-mold. There are also four pegs driven into the table at the corners of the block-and-stock board, to sustain the mold and regulate the thickness of the tile.

**mold-loft** (môld'loft), *n.* A large room in a ship-building yard in which the several parts of a ship are drawn out in their proper dimensions from the construction drawings. Also called *matching-loft*.

[The] various problems [of laying out] are solved upon the floor of a building known as the *Mould Loft*, where the drawings furnished by the designer are transferred in chalk lines in full size, and then by the aid of geometry, and in the manner discussed in the following pages, the draughtsman determines and draws in the shapes of the various components of the frame. Moulds are made to the lines, and with these moulds and other data furnished by the draughtsman the workmen are enabled to trim the timbers, or bend the angle-irons, and place such marks upon them as shall leave nothing but the putting together and fastening them in their places in order to construct the frame of the ship.

**mollusc**, *n.* See *mollusk*.

**Mollusca** (mol-lus'kä), *n. pl.* [NL., pl. of *molluscum*, a soft-bodied animal, a mollusk; see *mollusk*.] One of the leading divisions of invertebrate animals; an extensive series of invertebrates whose bodies are soft, without any jointed legs, and commonly covered with a hard

shell in one, two, or more pieces, and whose principal parts are neither segmented into a series of longitudinal rings, as in insects, crustaceans, and worms, nor radiately arranged, as in echinoderms; the mollusks, as the univalve or bivalve shell-fish of ordinary language. Mollusks have no trace of a notochord or notochord, which distinguishes them from certain organisms, as ascidians, formerly classed with them. They are primitively bilaterally symmetrical, or have a right and left "side" along a main axis; this form is best expressed in the chitons, and is evident in bivalves, slugs, etc., but its expression is often obscured by a twisting to which the body is subjected in various univalves, as those whose shells are spiral. (See *Isopleura*, *Autisopleura*.) There is always a well-defined alimentary canal, with definite walls. A nervous system is well developed as a set of ganglia with connecting commissures, one characteristic feature of which is the formation of a nervous ring or collar around the gullet, and another is the torsion of the visceral commissures in those forms whose bodies are twisted as above said. (See *Euthyrea*, *Streptoneura*.) Most mollusks have a distinct head, which, however, is not apparent in bivalves, leading to a division of headless mollusks (*Acephala* or *Lipocephala*). A characteristic organ of *Glossophora* or mollusks with heads is the odontophore, buccal mass, or lingual ribbon, whose radula serves as a rasping-organ in a mouth otherwise soft and toothless. Various modifications of the radular teeth give rise to several descriptive terms. (See *plumose*, *rachyglossate*, *rhynchoglossate*, *truncoglossate*.) There is always a heart, with a ventricle and at least one auricle, and dorsal in position. Its relative situation with respect to the gills differs in certain groups of mollusks. (See *opisthobranchiate*, *prosobranchiate*.) The circulation is double. The respiratory system is branchial, and in some cases, as of snails and slugs, modified for breathing air into a kind of lung. (See *Pulmonata*, *Gastropoda*.) The primitive typical gills are paired organs called *ctenidia*; but these undergo many modifications, and their function of respiration may be assumed vicariously by other parts of the body not homologous with them. These modifications give rise to the names of many subordinate groups of mollusks, especially of gastropods, besides that of the great series *Lamellibranchiata*. The renal organs of mollusks are technically called *nephridia*, or organs of *Bojanus*. (See cut under *Lamellibranchiata*.) The sexual organs are developed, either in the same individuals, or in different individuals of opposite sexes. The characteristic organ of locomotion is the foot or *podium*, a development of the under surface of the body, which may be a broad flat sole (see cut under *Gastropoda*), upon which the mollusk creeps, or otherwise shaped. It is often wanting, as in the oyster, or may give rise to a thready byssus by which the animal is rooted, as in the mussel. Forms of the *podium* give names to most of the leading groups of mollusks, as *cephalopods*, *pteropods*, *scaphopods*, *heteropods*, *gastropods*, and *plecypods*. A large part of the soft integument of mollusks forms what is called the *mantle* or *pallium*, from which the shell, when present, is developed (see *integropalliate*, *sinuipalliate*), and the impression of the edge of the mantle on the inside of the shell is the *pallial line*. Some mollusks are entirely naked, or have only a rudimentary and concealed shell, as land slugs and sea-slugs, and also most of the living cephalopods. The body of cephalopods is strengthened by an internal skeleton, the calamary or cuttlebone, though no mollusk has an articulated internal skeleton. But the great majority of mollusks have a hard shell (whence the old names *Testacea*, *Gastropodermata*), of a horny or chitinous or more decidedly calcareous substance. Those whose shell is single are called *univalves*; those in which it forms a hinged pair of shells are *bivalves*; but the former may have an additional shelly piece, closing the aperture, the *operculum*; and the two main valves of the latter may be supplemented by accessory valves (see cut under *accessory*). *Bivalves* are the natural group of headless or lamellibranch mollusks; but *univalves* include several orders, though the word is chiefly used of the numerous and conspicuous gastropods. A few mollusks are technically *mollitabæ*; such are the chitons, hence called *Polyplocophora*, having several segments of the shell in lengthwise series. (See cut under *chiton*.) Cirrripeds used to be considered multivalve mollusks. The shell is usually covered outside with a rough skin or *epidermis*; inside it may be beautifully lustrous, as with mother-of-pearl. Most mollusks live either in salt, brackish, or fresh water; land-mollusks are mostly found in damp places. Most are locomotory, either by creeping or by swimming; some swim by flapping their shells, others by moving various appendages; many adhere to or even burrow deeply in rocks; a few are parasitic. Some are carnivorous, others herbivorous; most are oviparous, a few ovoviviparous. Many are important as food, and the shells of many are put to useful or ornamental purposes. Certain bivalves furnish pearls. The *Mollusca* have been variously rated, limited, and classified; at one time the bodies of the animals were differently named from their shells. (See *Linnaæ*.) (1) The name was originally proposed by Jouston in 1650 for naked cephalopods and for *Aplysia*, and adopted by Linnaeus in 1758 as his second order of *Vermes*, including similar naked forms and some heterogeneous elements. Linnaeus made the *Testacea* or shelled mollusks his third order of *Vermes*; and these two groups were combined as a class by Poli in 1791. (2) About 1800 Cuvier made *Mollusca* the second of his four branches of the animal kingdom, with seven classes, *Cephalopoda*, *Gastropoda*, *Pteropoda*, *Acephala*, *Brachiopoda*, *Nuda*, and *Cirrhopoda* (the *Nuda* being ascidians, and the *Cirrhopoda* being crustaceans). (3) In Lamarck's system, 1819, *Mollusca*, as a class, were exclusive of the bivalves (called by him *Conchifera*), and were divided into five orders, *Pteropoda*, *Gastropoda*, *Trachelipoda*, *Cephalopoda*, and *Heteropoda*. (4) In 1839 Swainson extended *Mollusca* to all invertebrates except the articulate. (5) The cirrripeds having been recognized as crustaceans by Thompson in 1830, and the same naturalist having at the same time investigated the polyzoans, the relation of the latter to the brachiopods led H. Milne-Edwards in 1844 to associate the two Cuvierian groups *Brachiopoda* and *Nuda* with the *Polyzoa* in a division called *Mollusca* (the vertebrate affinities of the *Nuda* or ascidians not being recognized till much later, in 1866). (6) These dissociations from *Mollusca* in a former

sense have left the group now generally recognized and as above defined. It is regarded as a phylum whose main divisions are classes. These main groups are, in one series of headless mollusks, *Acephala* or *Lipnerphala*, the single class variously called *Conchifera*, *Laemellibranchiata*, *Elatobranchia*, *Pelecypoda*, *Cornuopoda*, and by other names of bivalves; and, in another series, *Cephalopoda*, *Odontophora*, or *Glossophora*, the four classes *Gastropoda*, *Scaphopoda*, *Pteropoda*, and *Cephalopoda*. But from among the gastropods are to be taken the chitons (together with *Neomenia* and *Charadrioida*), unless *Gastropoda* is used in a very broad sense; and some authors also dissociate the heteropods as a class. See further under the above technical names.

**molt**<sup>2</sup>, **moult**<sup>1</sup> (mólt), *n.* [*< molt*<sup>2</sup>, *moult*<sup>1</sup>, *v.*] **1.** The act or process of shedding or casting any tegumentary, cuticular, or exoskeletal structures or appendages, as feathers, hair, skin, nails, horns, hoofs, claws, or shell; ecdysis; exuviation. The surface of the body of most animals, outside of the parts which are vascular or supplied with blood, is worn away by friction, attrition, or other mechanical means. This process may be slight and gradual or continuous, as in the case of man, where it results in scurf-skin and dandruff; or it may be periodical and very extensive, affecting the whole cuticle or its appendages. Mammals shed their hair usually once a year. Birds molt their feathers usually at least once, often twice, sometimes three a year, the last two cases constituting the *double* and the *triple molt*. Both these classes of animals, in some cases, molt cuticular substances in mass. Thus, the American antelope sheds the sheath of the horn; lemmings and ptarmigans drop their claws; some birds of the auk family shed the horny parts of the beak; snakes cast their cuticle whole, even to the layer over the eyeball; crustaceans slough the whole shell; and numberless other invertebrates have a proper molt of similar or analogous character.

**molybdenous** (mō-lib-dē'nus), *a.* [*< molybda* + *-ous*.] Pertaining to or obtained from molybdenum.

**molybdenum** (mō-lib-dē'nūm), *n.* [*< NL. molybdænum*, a later form for L. *molybdæna*; see *molybdæna*.] Chemical symbol, Mo; atomic weight, 95.8. A metal of a silver-white color, but harder than silver, which fuses with difficulty, if at all, at the highest temperature of a wind-furnace. Its specific gravity is 8.6. It is chemically related to chromium, tungsten, and uranium, and, like those metals, forms trioxides which are acid-forming and yield very characteristic salts. It is remarkable for the number of oxides and corresponding chlorides which it forms; but it is the least important economically of the group to which it belongs. The most abundant ore of molybdenum is the sulphuret (molybdenite), and the strong external resemblance of this mineral to graphite (Latin *plumbago*) led to the confusion of molybdæna with that substance; moreover, external resemblance and certain chemical peculiarities caused still further difficulties of nomenclature, in which manganese, antimony, and even magnesia were involved. Thus, the peroxid of manganese was called by Linnaeus *molybdenum magnesi*. These perplexities were not cleared up until toward the end of the last century; but finally, as the result of the labors of Scheele, Bergman, and Hjelrn (1778-90), the metal

molybdæna, or molybdenum, as it is now more generally called, was isolated from its combinations. The ores of molybdenum are somewhat widely diffused, but rarely occur in any considerable quantity. The principal molybdeniferous minerals are molybdenite and wulfenite. There is also a molybdic ocher (the trioxid) and a carbonate (patenate); various ores of iron also contain traces of this metal.

The principle of living in the manner of monks; the system or course of life pursued by monks and nuns; primarily, the practice of living alone in religious retirement from the world; religious seclusion; secondarily, the corporate life of religious communities under vows of poverty, celibacy, and obedience to a superior. See *monk*.

The root-idea of *monachism* is . . . retirement from society in search of some ideal of life which society cannot supply, but which is thought attainable by abnegation of self and withdrawal from the world. This definition applies to all forms of *monachism*, . . . whether amongst Brahmins, Buddhists, Jews, Christians, Moslems, or the communistic societies of the present day, even when theoretically anti-theological. This broad general conception of *monachism* is differentiated in the following ways:—It may take the form of absolute separation, so far as practicable, from all human intercourse, so as to give the whole life to solitary contemplation—the anchoritic type; or it may seek fellowship with kindred spirits in a new association for the same common end—the cenobitic type; it may abandon society as incurably corrupt, as a City of Destruction out of which the fugitive must flee absolutely—the oriental view, for the most part; or it may consider itself as having a mission to influence and regenerate society—which has been, on the whole, and with minor exceptions, the Western theory of the monastic life.

*Encyc. Brit.*, XVI. 608.

**monad** (mon'ad), *n. and a.* [= F. *monade* = Sp. *monada* = Pg. *monada* = It. *monade*, < LL. *monas* (*monad*), < Gr. *μῆνος* (*monad*), a unit, unity, as adj. solitary, single, < *μῆνος* (*lonie* *monos*, Doric *monos*, orig. *monos*), alone, solitary, single, sole, only; appar. akin to *μία*, fem. of *εἷς* (*hē*), one.] I. *n.* 1. In *metaph.*, an individual and indivisible substance. The word was introduced into philosophy by Giordano Bruno to denote the minimum parts of substances supposed by him to be at once psychical and material. In the philosophy of Leibnitz the conception of the monad is that of an absolutely unextended substance existing in space, its existence consisting in its activities, which are ideas; and the universe was conceived by him as made up of such existences. The history of each

monad follows an internal law, and all interaction between the monads is excluded; but there is a preestablished harmony between these laws for the different monads. (See *Leibnitzian*.) The Leibnitzian theory of the monad was, in many particulars, revived by Hermann Lotze.

Pythagoras his monads, so much talked of, were nothing else but corporeal atoms.

*Cudworth*, *Intellectual System*, p. 13.

The soul is a *monad* (according to Bruno). It is never entirely without a body. God is the *monad of monads*; he is the minimum, because all things are external to him, and at the same time the maximum, since all things are in him. . . . The atoms of the ancients differed from one another in magnitude, figure, and position, but not qualitatively or in internal character. The *monads* of Leibnitz, on the contrary, are qualitatively differentiated by their ideas. All *monads* have ideas, but the ideas of the different *monads* are of different degrees of clearness. . . . God is the primitive *monad*; all other *monads* are its fulgurations. *Ueberweg*, *Hist. Philos.* (tr. by Morris), II. 27.

2. In *biol.*: (*a*) Any simple single-celled organism. The name covers a great many similar but not necessarily related unicellular organisms, some of which are monads in sense (*b*), others being plants; others again are free flagellate cells representing an embryonic condition of some other organism or of wholly indeterminate character.

We are warranted in considering the body as a commonwealth of *monads*, each of which has independent powers of life, growth, and reproduction.

*II. Spencer*, *Social Statics*, p. 493.

(*b*) In *zool.*, specifically, a flagellate infusorian; one of the *Infusoria flagellata*, characterized by the possession of one or two long whip-like flagella, and generally exhibiting an endoplast and a contractile vacuole. The word in this sense is derived from the name of the genus *Monas*.—3. In *chem.*, an element whose atoms have the lowest valence or atomicity, which valence is therefore taken as unity.

II. *a.* In *chem.* and *biol.*, of or pertaining to monads; of the nature of a monad; monadiform.

Many *monad* metals give us their line spectra at a low degree of heat. *J. N. Lockyer*, *Spect. Anal.*, p. 124.

There is reason to think that certain organisms which pass through a *monad* stage of existence, such as the Myxomyces, are, at one time of their lives, dependent upon external sources for their protein matter, or are animals; and, at another period, manufacture it, or are plants.

**monad-deme** (mon'ad-dēm), *n.* [*< monad* + *deme<sup>2</sup>*.] A colony or aggregate of undifferentiated monads.

E. Caird, Philos. of Kant, p. 86.

2. The application of the conception of the monad to the solution of the problems of chemistry and physics; atomism.

They were divided into two groups—the *dynamic* (*dynamicists*) or *rationalistic Monarchians*, who regarded Christ as filled with a divine power and denied his divinity, and the *Patristicists*, who regarded the Father and the Son as the same; the latter were called *modalistic Monarchians*, from their advocacy of a threefold mode or manifestation of the deity.

By *Monarchians* of the former [dynamicist] class Christ was held to be a mere man, miraculously conceived indeed, but constituted the Son of God simply by the infinitely

Supreme power wielded by a single person; absolute personal authority.

They imagined that he [Jesus] . . . should subdue the rest of the world, and make Jerusalem the seat of an universal monarchy. *Hooker, Eccles. Polity, vii. 16.*

But let us not deceive our selves, the pretensions are as high and as great at Rome to this Monarchy as ever they were. *Stillington, sermons, II. ii.*

2. The principle of government by a monarch; the monarchical system.

The first, the most ancient, most general, and most approved, was the government of one ruling by just laws, called monarchy. *Raleigh, Hist. World, I. ix. 2.*

I hear there are people among you who think the experience of our governments has already proved that republican governments will not answer. Send those gentlemen here, to count the blessings of monarchy. *Jefferson, Correspondence, II. 221.*

3. A government in which the supreme power is either actually or nominally lodged in the hands of a monarch or sole ruler, who holds his position for life, generally with hereditary succession. There have been *elective monarchies*, in which the successor to a deceased sovereign was chosen without obligatory regard to the hereditary principle; but this principle has finally prevailed, to the exclusion of choice, in all existing civilized monarchies. The former kingdom of Poland was a purely elective monarchy. The German-Roman empire was originally, and always nominally, elective; but for many centuries the chosen successor was almost invariably the heir of the former emperor. An *absolute or despotic monarchy* is one in which the will of the monarch or sovereign is supreme over all other authority or powers of government; a *limited or constitutional monarchy*, one in which the sovereign is limited to the exercise of particular powers or functions by the laws or constitution of the realm. More or less limited monarchies have nearly always existed. About the fifteenth century a noteworthy increase of the power of the sovereign took place (as in England under Edward IV., in France under Louis XI., in Spain under Ferdinand and the Catholic and Charles V.). Till the close of the eighteenth century the prevalent theory and practice on the continent constituted nearly unrestricted absolutism; this has now almost disappeared from Europe, while still maintaining a foothold in Asia. But whether absolute or limited the monarch is theoretically regarded as the source of all power, and all acts of government are done in his name.

The obvious definition of a monarchy seems to be that of a state in which a single person, by whatsoever name he may be distinguished, is intrusted with the execution of the laws, the management of the revenue, and the command of the army. But, unless public liberty is protected by intrepid and vigilant guardians, the authority of so formidable a magistrate will soon degenerate into despotism. *Gibbon.*

It has often indeed been noticed that a Feudal Monarchy was an exact counterpart of a Feudal Manor, but the reason of the correspondence is only now beginning to dawn upon us. *Maine, Early Hist. of Institutions, p. 77.*

4. The territory ruled over by a monarch; a kingdom; an empire.

What scourge for perjury  
Can this dark monarchy afford false Clarence?

ing fifteen nerves, which is almost equally five-toothed. **monastery** (mon'as-të-ri), *n.*: pl. *monasteries* (-riz). [*In early form münster, q. v.; = F. monastère = Sp. monasterio = Pg. mosteiro = It. monasterio = Bulg. monastiri, monastiri = Serv. manastir = Pol. monasterz = Hung. monostor (< Slav.). < LL. monasterium, < Gr. μοναστήριον, a solitary dwelling, in LGr. a monastery, cf. LGr. μοναστήριος, adj., Gr. μοναχός, a solitary, LGr. a monk, < μονάξω, be alone, dwell alone, < μόνος, alone; see monad.* Cf. *monk*, from the same ult. source.] A house or other place of residence occupied in common by persons seeking religious seclusion from the world; commonly applied to such a house exclusively used by monks. The term, however, strictly includes the abbey, the priory, the nunnery, and the friary, and in this broad use is synonymous with *convent*. Monasteries in the Christian church were probably first established in the fourth century. St. Benedict of Nursia in the sixth century established a monastic rule which has been the foundation of nearly all the rules which govern monastic vows. Vows under different rules were made from the beginning of Christianity. The

number of monasteries in Europe was much diminished at the Reformation, when their rich estates were in part appropriated by sovereigns to their own use, and in part transferred to universities and other educational institutions, etc. We owe to the monasteries the first definite beginnings or revival of civilization in many countries, especially Germany and France, almost all the missionary work of the early middle ages, and the preservation of nearly all ancient classical and early medieval literature. The monastic life has been practised from pre-Christian times among the Buddhists. See *rule*.

The moners consist of indifferently protoplasm containing no nucleus or endoplast, and thus are conveniently, if not naturally, distinguished from the higher series of protozoans known as *Eudoplasmata*.

**Monera** (mō-nē'rā), *n. pl.* [*N.L.*, pl. of *moneron*.] 1. Haeckel's name of a class of protozoans of the simplest possible characters. The *Monera* are apparently structureless particles of protoplasm, agreeing with other rhizopods in protruding pseudopods, but differing from the normal ameboids in lacking any recognizable nucleus. Unlike foraminifers, they form no shell. The group is provisional and perhaps hypothetical. The name is that of a legitimate biological conception; but since it is by no means certain that every moner is not a stage or state of a somewhat more definitely organized rhizopod, the group so named has no assured zoological standing. The *Monera* are sometimes nominally divided into *Gymnomonera* and *Lepomonera*, the former of which are always naked, while the latter may acquire a cell-wall. Also *Monerozoa*.

2. [*L. c.*] Plural of *moneron*.

**moneral** (mō-nē'ral), *a.* [*< Monera* + *-al*.] Same as *moneran*.

[*N.L.*, dim., < Gr. *μονήριον*, single, solitary; see *moneron*.] In *embryol.*, a name given by Haeckel to a supposed non-nucleated stage of an impregnated ovum, when it has the form-value of a simple cytode, or moner. It is supposed that the nucleated ovum, immediately upon fecundation by spermatozoa, undergoes retrogressive metamorphosis, loses its nucleus, and becomes a mere mass of protoplasm; that then a new nucleus is formed, in the formation of which the spermatic protoplasm takes part; and that thereupon the ovum resumes its form-value of a nucleated cell as a cytula, having been a monerula in the interval between the loss of the original nucleus and the acquisition of the new one. The word is one of a series of other members of which are *cytula*, *morula*, *blastula*, and *gastrula*.

**Moneses** (mō-nē'sez), *n.* [*N.L.* (Salisbury, 1821), prob. so named on account of the pretty and solitary flower: < Gr. *μόνος*, alone, + *γεν.*, de-light.] A genus of plants of the natural order *Ericaceae* and the tribe *Pyroleae*, characterized by spreading petals, by the capsule opening upward from the base, and by solitary flowers. There is but a single species, *M. uniflora*, the one flowered pyrola, which is a small perennial with rounded and veiny serrate leaves and a scape bearing a white or rose-colored flower. 2. In a wider sense, any article of value which is generally accepted as a medium of exchange; also, by extension, something which, though possessing little or no intrinsic value, is recognized and accepted as a substitute for money as above defined, such as paper money; any circulating medium of exchange. Money is adopted for the sake of convenience to facilitate the exchange of one kind of wealth for another and as a standard of value. Its common form is that of a stamped metallic currency; but in primitive times, among uncivilized peoples and under special conditions by civilized people, many other articles have been used as money. Bank-notes, greenbacks, gold and silver certificates of the United States government, etc., all representing coin, are called *paper money*, and are used for convenience instead of the coin

itself. *Money* in this sense is not often used in the plural, unless to indicate sums of money or different systems of money or coinage. See *def.* 4.

**Right money,** money paid as the condition or consideration of acquiring a right to the purchase of lands.

It will be well to deal with a use of the phrase *value of money* which has led to much confusion. In mercantile phraseology the *value of money* means the interest charged for the use of loanable capital. Thus, when the market rate of interest is high, money is said to be dear, when it is low, money is regarded as cheap. Whatever may be the force of the reasons in favour of this use, it is only mentioned here for the purpose of excluding it. For our present subject, the value of a thing is what it will exchange for; the *value of money* is what money will exchange for, or its purchasing power. If prices are low, money will buy much of other things, and is of high value. The *value of money* is inversely as general prices, falling as they rise and rising as they fall.

(Du Petit-Thouars, 1804), suggested by its affinity to a genus previously named *Mithridatea*, < L. *Monima*, < Gr. *Monia*, wife of Mithridates.] A genus of dicotyledonous apetalous plants, type of the natural order *Monimiaceae* and of the tribe *Monimieae*. It is characterized by globose dioecious flowers, the staminate becoming split into four to six lobes, by numerous stamens, each bearing two glands at its base, and by the fruit, which consists of several very small one-seeded drupes enclosed within the enlarged perianth. Three species are known, natives of the Mascarene Islands. They are shrubs with rigid opposite leaves, and very small flowers, closely clustered in the axils. Fossil plants of this genus occur in the Tertiary formations of Europe and of Australia, and closely allied forms, called *Monimiopsis*, at the very base of that formation in France and in the Fort Union group on the Yellowstone river in Montana.

**Monimiaceae** (mō-nīm-i-ä'sē-ē), *n. pl.* [NL. (Endlicher, 1836), < *Monimia* + *-aceae*.] A natural order of dicotyledonous plants of the apetalous series *Micrombrayceae*, typified by the genus *Monimia*. It is characterized by a globose or cup-shaped perianth, toothed or deeply divided at the border, by numerous stamens covering the perianth, and by having several or many distinct ovaries, each with a single ovule, a minute embryo, and copious fleshy albumen. The order includes about 22 genera and 150 species, natives of the warmer parts of South America, Asia, and the South Pacific islands. They are trees, shrubs, or rarely climbers, generally aromatic, with rigid opposite leaves and small flowers, in axillary or sometimes terminal clusters, which are shorter than the leaves. Several furnish wood for building and cabinet-work, or leaves used as a tonic or an aromatic seasoning.

**Monimieae** (mon-i-mī'ē-ē), *n. pl.* [NL. (A. L. de Jussieu, 1809), < *Monimia* + *-eae*.] A tribe of plants of the natural order *Monimiaceae*, of which *Monimia* is the type. It is characterized by having pendulous ovules, and anthers opening by a longitudinal fissure (instead of uplifting valves as in the other tribe of the order, *Athoragaceae*). It includes 8 genera, natives of tropical America, Australia, and adjacent islands, with one genus in Africa.

**monishment** (mon-'ish-ment), *n.* [*<* *monish* + *-ment*.] Admonition. *Shirwood*.

**monism** (mon-'izm), *n.* [*<* Gr. *monos*, single, + *-ism*.] 1. Any system of thought which seeks to deduce all the varied phenomena of both the physical and spiritual worlds from a single principle; specifically, the metaphysical doctrine that there is but one substance, either mind (idealism) or matter (materialism), or a substance that is neither mind nor matter, but is the substantial ground of both: opposed to *dualism*. The term was applied by Wolf, its inventor, to the forms of the doctrine which were then known, namely, to the denial of the substantiality either of mind or matter; but it is now extended to the doctrine that the distinction between physical and mental facts is only phenomenal, and that in themselves they are not distinguished. Many special modifications of monistic speculation, especially on its materialistic side, have accompanied the recent developments of physical science, particularly the doctrine of evolution. (See quotation from Haeckel under *monistic*.) Such doctrines as that energy, electricity, etc., are categories of substance different from matter are not taken account of by those who use the term, so that it is not easy to say whether they would be considered as denials of monism or not. Also called *unitism* and *unitarionism*.

*Monism* led a miserable existence in philosophical dictionaries, until, as a denotation of the Hegelian philosophy, it obtained a very wide use. It had again in some measure fallen out of use when it was taken up by modern natural philosophy, and made the watchword of a doctrine which considers mind and matter neither as separated nor as derived from each other, but as standing in an essential and inseparable connection.

*M. S. Phelps*, tr. of Eucken's *Fundamental Concepts*, p. 114. If the essence of the materialist hypothesis be to start with matter on its lowest terms, and work it thence up into its highest, I did it no wrong in taking "homogeneous extended solids" as its specified datum and its only one; so that it constituted a system of *monism*.

*J. Martineau*, *Materialism* (1874), p. 108.

2. Any theory or system which attempts to explain many heterogeneous phenomena by a single principle.

The solution offered by Psychophysical *Monism*, that functional brain-motion and feeling are two aspects of one and the same fact in nature—this solution, when closely examined, turns out to be an altogether dualistic and unthinkable assertion. *E. Montgomery*, *Mind*, ix. 306.

3. In *biol.*, same as *monogenesis* (c). — **Hylozoistic monism**. Same as *hylozoism*. — **Idealistic monism**, the monism which regards the single principle of the universe as mind or spirit, of which matter is the product. — **Materialistic monism**, the monism which regards the single principle as matter, of which mind or spirit is the product. **monist** (mon-'ist), *n.* and *a.* [*<* *mon(ism)* + *-ist*.]

1. *n.* An adherent of the metaphysical doctrine of monism in some one of its forms.

The philosophical unitarians or *monists* reject the testimony of consciousness to the ultimate duality of the subject and object in perception, but they arrive at the unity of these in different ways. Some admit the testimony of consciousness to the equipose of the mental and material phenomena, and do not attempt to reduce either mind to matter, or matter to mind. They reject, however, the evidence of consciousness to their antithesis in existence, and maintain that mind and matter are only phenomenal modifications of the same common substance. This is the doctrine of absolute identity—a doctrine of which the most illustrious representatives among recent philosophers are Schelling, Hegel, and Cousin. Others again deny the evidence of consciousness to the equipose of subject and object as coordinate and original elements; and, as the balance is inclined in favor of the one relative or the other, two opposite schemes of psychology are determined. If the subject be taken as the original and genetic, and the object be evolved from it as its product, the theory of idealism is established. On the other hand, if the object be assumed as the original and genetic, and the subject be evolved from it as its product, the theory of materialism is established. *Sir W. Hamilton*, *Metaph.*, xvi.

II. *a.* Same as *monistic*.

**monistic** (mō-nis'tik), *a.* [*<* Gr. *monos*, single, + *-ist-ic*.] Of or pertaining to monism; of the nature of monism. See *monism* and *monist*.

Idealism is *monistic* in its whole conception of the universe. It claims to be a "one-substance" theory, although it should in consistency call itself a "no-substance" theory instead. *Bibliotheca Sacra*, XLV. 103.

The opponents of the doctrine of evolution are very fond of branding the *monistic* philosophy grounded upon it as "materialism," by confusing philosophical materialism with the wholly different and censurable moral materialism. Strictly, however, our monism might, as accurately or as inaccurately, be called spiritualism as materialism. The real materialistic philosophy asserts that the vital phenomena of motion, like all other phenomena of motion, are effects or products of matter. The other, opposite extreme, spiritualistic philosophy, asserts, on the contrary, that matter is the product of motive force, and that all ma-

terial forms are produced by free forces entirely independent of the matter itself. Thus, according to the materialistic conception of the universe, matter or substance precedes motion or active force. According to the spiritualistic conception of the universe, on the contrary, active force precedes matter. Both views are dualistic, and we hold both of them to be equally false. A contrast to both views is presented in the *monistic* philosophy, which can as little believe in force without matter as in matter without force. *Haeckel*, *Evolution of Man* (trans.), II. 456.

Cf. *monastery* and *minster*, from the same source.] 1. Originally, a man who retired from the world for religious meditation and the practice of religious duties in solitude; a religious hermit; in later use, a member of a community or fraternity of men formed for the practice of religious devotions and duties, and bound by the vows of poverty, celibacy, and obedience to a superior; specifically, a regular male denizen of a monastery. Communities of a more or less monastic character in Palestine and Egypt before the diffusion of Christianity were the Essenes and Therapeutæ (which see). The ordinary Christian life of the first three centuries, even when not celibate, was largely ascetic and in communities. Christian monasticism in a definite form originated in Upper Egypt in the third or fourth century (perhaps with St. Anthony; according to other accounts it is traced to the ascetic Paul, about A. D. 250). The first monks were anchorites, living in solitude. The collection of anchorites in a monastery (*clauis* or *cenobium*) is ascribed to Pachomius, in the fourth century. The institution spread rapidly, and was greatly helped in the West by the establishment of the Benedictine order in the sixth century. Various developments of the monastic system are to be found in the middle ages, as the military orders, friars (often distinguished from monks proper), etc. Since the Reformation, and especially since the French revolution, monachism has declined in Western countries, or has been overshadowed by the society of Jesuits, but still continues to flourish in Eastern churches.

simian; any one of the *Primates* except man and the lemurs; an ape, baboon, marmoset, etc. The term is very vague, and has no technical or fixed restriction. Those monkeys which have very short tails and faces are commonly called *apes*, most of them belonging to the higher family *Simiidae*. The monkeys with long faces like dogs are usually termed *baboons*; they are at the bottom of the series of Old World simians, in the family *Cynocephalidae*. The small bushy-tailed monkeys of America are usually known as *marmosets*. Excluding these, the name *monkey* applies mainly to long-tailed simians of either hemisphere. All the Old World monkeys, in any sense of the word, are catarrhine, and have 32 teeth, as in man. They constitute two families, *Simiidae* and *Cynocephalidae*. (See *cuts* under *Cercopithecus*, *Catarrhini*, and *Diana*, 2.) All the New World monkeys are platyrrhine; there are two families, *Cebidae*, with 36 teeth and mostly prehensile tails, and *Midiidae* or marmosets, with 32 teeth and bushy non-prehensile tails. (See *cuts* under *Cebina*, *Eriodonta*, and *Lagothrix*.) The genera of monkeys are about 35 in number, including several that are fossil. The species are particularly numerous in Africa and South America, especially in the tropical parts. There are many, however, in the warmer parts of Asia and even up to the snow-line; a single one is found in Europe, the Barbary ape, *Uinus catus*. (See *cut* at *ape*.) Almost all the leading species have specific names in the vernacular as well as their technical scientific designations.

A monochromatic light gives a single bright line when viewed with the spectro-

scope.

*Monochromy* is advantageously employed when it is desired, on the one hand, to avoid the brilliancy attendant on the introduction of several distinct colours, and, on the other, the dullness consequent on the exclusive use of a single tone. O. N. Road, *Modern Chromatics*, p. 310.

**monochronic** (mon-ō-kron'ik), *a.* [*<* LL. *monochronos*, of the same time or measure, < Gr. *μονοχρονος*, of the same time or measure, consisting of one time or measure, temporary, < *monos*, single, + *χρονος*, time.] Of one and the same time; existing or happening at the same time; contemporaneous; in *geol.*, deposited, or apparently deposited, at the same period: said of organic remains.

Rogers (1812), and has taken the place of Darwin's hybrid word *unibclinal*; thus, *monoclinial valley* (a valley bounded by ridges the strata of which all dip in the same direction); *monoclinial ridge*; *monoclinial flexure*, etc. A *monoclinial flexure* may be regarded as a half of an anticlinal fold, which would have been completed had the flexing action not been limited to one side of the axis, the strata resuming their horizontality on the other side.

The Echo Cliff flexure, the Water-Pocket flexure, one of the grandest monoclines of the west, and the San Rafael flexure, all *monoclinial* flexures of imposing dimensions and perfect form. Capt. Dutton considers go far back in Tertiary time, and possibly are pre-Tertiary.

From the structure of the stem, increasing by internal or endogenous growth, they are also called *endogens*. The wood of their stems occurs in longitudinal bundles of fibers, scattered, as in Indian corn, or becoming compact, as in palms. New bundles of fibers form between the old, not, as in dicotyledons or exogens, in an annual external layer enveloping the stem. The class is divided into 34 orders, among which are the lily, iris, amaryllis, orchis, banana, palm, pineapple, screwpine, arum, rush, sedge, and grass families. By Bentham and Hooker these are classed in seven groups or series; by others in three, the spadicous, petaloidous, and glumaceous divisions. The term is specially applied to the modern style which arose somewhat before 1600 in Italy, and which led rapidly to the invention and great popularity of the opera, the oratorio, and the instrumental suite. Among Monophysites in the wider sense are included the Eutychians and Monothelites. The sect of Eutychians was founded by Eutyches, who was condemned at the Council of Chalcedon, A. D. 451. They taught that there is but one nature in Christ, the divine. The Monophysites properly so called hold that the divine and human natures in Christ are combined into one composite nature. The first leaders of the Monophysites, and founders of the present Monophysite or Coptic Church of Egypt, were Dioscorus, condemned at Chalcedon (died A. D. 454), and Timothy II. Flavius ('Cat'), made patriarch A. D. 457. In later times their most important leader was Severus, about A. D. 520, whose followers were called *Severians*, *Corruptiores*, or *Pharabologues*, while those of an opposite Monophysite sect were known as *Julianists*, *Apharabaches*, and *Phantasiasts*. In the sixth century the Monophysites spread widely in Syria, and were named *Jacobites*, from Jacob Baradaeus, Bishop of Edessa, 541-78. At various times the Monophysites divided into a great number of sects, known by more than thirty different titles. These represented different shades of original Eutychianism and Monophysitism and attempts at approach to orthodoxy. The most subtle form of Monophysitism is Monothelitism (which see). Monophysitism is at the opposite pole of doctrine to Nestorianism, the orthodox doctrine as to the nature of Christ lying midway between the two. As distinguished from the Monophysites, the orthodox are called *Diphsites* and *Melchites*. At the present day the two great bodies of Monophysites are the Copts and the Syrian Jacobites. The Armenian Church is also often regarded as Monophysite or Eutychian, and the Maronites before their submission to the Roman Church were Monothelites. See *Acrophyl* (b), *Agnostæ*, *Theopaschite*, *Trithelite*.

In this scheme, not easy to define satisfactorily, Prof. Owen makes his "class *Reptilia*" cover not only *Reptilia* in the usual sense, but also *Amphibia* or *Batrachia*. His *Dipnoa* are then contemporaneous with *Amphibia* proper. He divides *Monopnoea* into the orders *Pterosauria*, *Pinosauria*, *Crocodylia*, *Chelonio*, *Lacertilia*, *Ophidia*, *Anomodontia*, *Sauronychia*, and *Ichthyopterygia*. *Comp. Anat. It. *monopolio*, < L. *monopolium*, < Gr. *μονοπώλιον*, a right of exclusive sale, *μονοπωλία*, exclusive sale, monopoly, < *μόνος*, sole, + *πωλείν*, barter, sale.] 1. An exclusive privilege to carry on a traffic.

*Monopolies* are much the same offence in other branches of trade that engrossing is in provisions, being a license or privilege allowed by the king for the sole buying and selling, making, working, or using of any thing whatsoever; whereby the subject in general is restrained from that liberty of manufacturing or trading which he had before.

*Blackstone*, Com. (ed. Waite), IV. 139.

2. Specifically, in *Eng. constitutional hist.*, and hence sometimes in *Amer. law*, such an exclusive privilege when granted by the crown or state to an individual, association, or corporation, for the sake of the pecuniary advantage of its exclusiveness. A privilege not granted by the state but secured by buying up the article, is termed by the English law *engrossing*. The legal objection to a monopoly, in this sense of the word, is that it can be secured only by forbidding all other citizens except the favored grantee to exercise a common law right. Exclusive privileges granted by the state to a limited number of persons for the sake of enabling the state better to regulate the traffic for the protection of the rest of the community, as in case of banking franchises, liquor traffic, etc., are not deemed monopolies, although the same privileges would be, if conferred on a single or a very few grantees, for the sake of the pecuniary benefit to them. So the exclusive privileges conferred on inventors and authors, by the patent and copyright laws, for the sake of the encouragement of the arts and literature, and extending only to articles originally devised under that encouragement, are not deemed mono-

lies. Both these classes of grants have, however, been condemned by some as partaking of the character of monopolies.

If any man, out of his own wit, industry, or endeavour, find out anything beneficial to the Commonwealth, or bring out any new invention which every subject of this kingdom may use, yet, in regard of his pains and travel therein, her Majesty perhaps is pleased to grant him a privilege to use the same only, by himself or his deputies, for a certain time. This is one kind of *Monopoly*. Sometimes there is a glut of things, when they be in excessive quantity, as perhaps of corn; and perhaps her Majesty gives licence of transportation to one man. This is another kind of *Monopoly*. Sometimes there is a scarcity or a small quantity; and the like is granted also.

*Bacon*, in E. A. Abbott's Account of his Life and Works.

I will have no private *monopolies*, to enrich one man, and beggar a multitude.

*Barbon*, Anat. of Mel., To the Reader, p. 68.

He thinks he can never trade to his advantage unless he can have the *monopoly* of everything he values.

*South*.

3. In *polit. econ.*, and as used in a general sense in law, such an exclusive privilege to carry on a traffic, or deal in or control a given class of articles, as will enable the holder to raise prices materially above what they would be if the traffic or dealing were free to citizens generally. In this sense, that exclusive control of a particular kind of product which results from the legitimate ownership of the only land from which it can be obtained, as in the case of some mineral waters, or earths, or ores is sometimes spoken of as a *natural monopoly*, in contrast to the *artificial monopolies* created by state grant. See *virtual monopoly*, below.

4. That which is the subject of a monopoly: as, in Bengal opium is a *monopoly*.—5. The possession or assumption of anything to the exclusion of other possessors: thus, a man is popularly said to have a *monopoly* of any business of which he has acquired complete control.

Jonson, who, by studying Horace, had been acquainted with the rules, yet seemed to envy to posterity that knowledge, and to make a *monopoly* of his learning.

*Dryden*, tr. of Juvenal, Ded.

Caleb hadn't no *monopoly* to court the scenerettes.

*Lowell*, Biglow Papers, 1st ser., ii.

6. Loosely, a company or corporation which enjoys a monopoly.—**Monopoly Act**, an English statute of 1623 (21 Jas. I., c. 3), declaring all monopolies for the manufacture, sale, or use of anything to be void, excepting to inventors their patent rights. Also known as the *Statute of Monopolies*.—**Virtual monopoly**, a term in constitutional law and the history of legislation (the appropriate applications of which have been much contested) used to characterize a business which, though not declared by law to be a monopoly or exclusive franchise protected as such, as by a patent or an exclusive charter, is yet so related to the great channels and currents of commerce that the allowing of it to enjoy the same protection as other private property and business secures to it indirectly exclusive advantages substantially equivalent to a legal monopoly. Thus the great grain-elevators of modern commerce, although erected as private property on private lands, if by their situation they have exclusive advantages for the transfer of grain from vessels at the wharf to the railroad terminals of a trunk-line, are said to constitute a *virtual monopoly*, because, if not subjected to a legislative power to restrict their charges such as other private property and business are not subjected to, they might be conducted in a manner oppressive to commerce.

The Monothelites argued that his will must be one, will being attached to personality. The orthodox argued that there must be two wills in him, as otherwise either the divine or the human nature would be imperfect, and cited the texts Mat. xxvi. 42; Luke xxii. 42; John v. 30, vi. 38. See *Monothelite*, 12. *Monothelism, Monothelism*.

It is much used as an element in chanting.

4. Something spoken or written in one tone or strain.

(b) The *sideral month*, or mean period required by the moon to make a circuit among the stars: it is 27 days, 7 hours, 43 minutes, 11.5 seconds. (c) The *tropical month*, or the mean period of the moon's passing through 360 degrees of longitude, as from one vernal equinox to the next: it differs from the sideral month only by an amount corresponding to the monthly precession of the equinoxes, and is 27 days, 7 hours, 43 minutes, 4.7 seconds. **4.** At common law and in equity, *month* has been understood to mean 'a lunar month,' which is assumed to be 28 days, except when the contrary appears, and except when used of mercantile transactions, such as negotiable paper, etc. In ecclesiastical law, and now in all cases throughout the United States generally, its legal meaning is 'a calendar month,' except when the contrary appears. For the purpose of calculating interest, a month is generally considered the twelfth part of a year, and as equivalent to 30 days. *5t. pl.* Same as *mensis*. *Minsken*; *Cotgrave*.

2. In *logic*, a variety of syllogism depending on the quantity (universal or particular) and quality (affirmative or negative) of the propositions composing it. In the traditional logic the names of the moods (invented by Petrus Hispanus) are—First figure, Barbara, Celarent, Darii, Ferio, Barabpton, Celantes, Dabitis, Fapesmo, Frisesomorum; Second figure, Cesare, Camestres, Festino, Baroco; Third figure, Darapti, Felapton, Disamis, Datisi, Bocardo, Ferison. These names are merely mnemonic, and many of their letters are significant. The vowel *a* denotes a universal affirmative proposition, *e* the universal negative, *i* the particular affirmative, and *o* the particular negative. By the first syllable is indicated the major premise, by the second the minor, and by the third the conclusion. For example, the name *Barbara* shows that the first mood of the first figure consists of two universal affirmative premises leading to a universal affirmative conclusion. The same understanding is to be had in regard to the vowels of the other words. Certain of the consonants also are significant. Thus, all indirect moods designated by a word beginning with *b* should be reduced to Barbara, the first mood of the first figure; all that are designated by a word beginning with *c* to the second mood, Celarent; all in *d* to Darii, the third; and all in *f* to Ferio, the fourth. Other letters indicate how to reduce indirect to direct moods: thus *s* signifies that the proposition denoted by the vowel immediately preceding is to be simply converted in the reduction; *p*, that the proposition denoted by the vowel immediately preceding should be converted per accidens; *m*, that the premises should be transposed—that is, the major should be made the minor, and conversely; and *e*, that the mood designated by the word in which it occurs should be reduced per impossibile: whence the verses:

Simplexiter vult *s* verti, *p* vero per acci;  
*M* vult transponi, *e* per impossibile duci.  
Servat majorem, variatque secunda minorem;  
Tertia majorem variat, servatque minorem.

A mood is a lawful placing of propositions in their dative quality or quantity. *Sir T. Wilson*, *Art of Logic*, fol. 26.

3. In *music*, same as *mood*<sup>1</sup>, 7.

Anon they move

Arming to battle. *Milton*, P. L., i. 550.

Turk. *māh*), moon, month. The relations of these forms to each other, and to the words for 'month' (see *month*), and their ult. root, are undetermined. The usual explanation is that the moon is the 'measurer' (sc. of time). *< √ ma*, Skt. *mā*, measure (whence ult. E. *metre*<sup>1</sup> and *measure*). The L. name of the moon (*luna*) and the L. Gr. and Teut. names for the sun (L. *sōl* = AS. *sōl*, etc.; Gr. *ήλιος*; AS. *sunne*, E. *sun*, etc.) come from other roots, meaning 'shine.'] 1. A heavenly body which revolves around the earth monthly, accompanying the earth as a satellite in its annual revolution, and shining by the sun's reflected light. Next to the sun, the moon is the most conspicuous and interesting of celestial objects. The rapidity of its motion, the variety of its phases, and especially the striking phenomena of eclipses, compelled the attention of the earliest observers; and the fact that lunar observations can be made available to determine the longitude has given the theory of the moon's motion the first rank in economic importance, while the mathematical problems involved have proved most interesting and fertile from the scientific point of view. Of all the heavenly bodies (meteors excepted) the moon is nearest to us. Its mean distance is a little more than sixty times the radius of the earth, or 238,500 miles. The dimensions of the moon as compared with those of the earth are far greater than those of any other satellite in proportion to its primary. Its

diameter is 2,162 miles (about 0.273 of the earth's equatorial diameter), and its volume, or bulk, is 0.0204, or about one forty-ninth of that of the earth. Its mean density, however (about 3.4 times that of water), is only about three fifths of that of the earth, and its mass about one eightieth. The inclination of its orbit to the ecliptic is 5° 8' 40". It completes its revolution around the earth in an average period of 27d. 7h. 43m. 11.5s., which constitutes the *sidereal* month; the ordinary, or *synodical*, month, from new moon to new moon again, is a little more than two days longer—29d. 12h. 44m. 2.7s. (See *month*.) The moon's orbital motion is subject to considerable inequalities, due to the disturbing action of the sun, and the investigation of these inequalities makes up the major part of the "lunar theory." The moon revolves on its axis once in a sidereal month, thus always presenting nearly the same face to the earth—a circumstance which has led to the fallacy of a denial of its rotation. (See *rotation*.) Its disk appears to the naked eye diversified by dark and bright patches, giving rise to the "man in the moon" of popular fancy (see under *man*); but on examination with a powerful telescope these are lost sight of, and replaced by a crowd of interesting objects, such as mountains and valleys, craters and clefts, on a scale unknown upon the earth: the surface-structure seems to be mainly volcanic, resembling very closely in certain respects, and differing most markedly in others from, that which is characteristic of volcanic regions on the earth's surface. The moon has no clouds, shows no indications of an atmosphere or of the presence of water, and is believed to have a temperature which at its maximum does not rise above the melting-point of ice. See *libration*.

2. The place of such a meeting.—3. In *early Eng. hist.*, a court formed by assembling the men of the village or tun, the hundred, or the kingdom, or their representatives. It exercised political and administrative functions with some judicial powers. Compare *writen-gr. mōt*. See the quotation.

The four or ten villagers who followed the reeve of each township to the general muster of the hundred were held to represent the whole body of the township from whence they came. Their voice was its voice, their doing its doing, their pledge its pledge. The hundred-moot, a *moot* which was made by this gathering of the representatives of the townships that lay within its bounds, thus became at once a court of appeal from the *moots* of each separate village as well as of arbitration in dispute between township and township. The judgment of graver crimes, and of life or death, fell to its share; while it necessarily possessed the same right of law-making for the hundred that the village-moot possessed for each separate village. And as hundred-moot stood above town-moot, so above the hundred-moot stood the Folk-moot, the general muster of the people in arms, at once war-host and highest law court, and general Parliament of the tribe. But whether in Folk-moot or hundred-moot, the principle of representation was preserved. In both the constitutional forms, the forms of deliberation and decision, were the same. In each the priests proclaimed silence, the ealdormen of higher blood spoke, groups of freemen from each township stood round, shaking their spears in assent, clashing shields in applause, settling matters in the end by loud shouts of "Aye" or "Nay."

"There are three reasons," says de Vigney, "which induced the philosopher to institute this new pastime: the first, to reclaim a wicked king; the second, to prevent illness; and the third, practically to demonstrate the nature and necessity of nobleness."

**Mormon**<sup>2</sup> (mōr'mon), *n.* [*Prop. attrib.* use (the *Mormon* Church, Bible, etc.) of *Mormon*, one of the characters of the "Book of Mormon," from whom it derives that name.] An adherent of a religious body in the United States, which calls itself "The Church of Jesus Christ of Latter-day Saints." This denomination was founded in 1830 by Joseph Smith, a native of Sharon, Vermont. The government of the church is a hierarchy consisting of two orders of priesthood, an order of Melchizedek (the higher) and an Aaronic or lesser order. The former is presided

over by a president and two counselors whose authority extends over the entire church, and it includes the twelve apostles, the seventies, the patriarch, the high priests, and the elders. The twelve apostles constitute a traveling high council, which ordains other officers and is intrusted with general ecclesiastical authority; the seventies are the missionaries and the propagandists of the body; the patriarch pronounces the blessing of the church; the high priests officiate in the offices of the church in the absence of any higher authorities; and the elders conduct meetings and superintend the priests. The Aaronic priesthood includes the bishops, the priests, the teachers, and the deacons; the two last named are the subordinate orders in the church. The duties of the bishops are largely secular. The entire territory governed by the church is divided and subdivided into districts, for the more efficient collection of tithes and the administration of the government. The Mormons accept the Bible, the Book of Mormon, and the Book of Doctrine and Covenants as authoritative, and regard the head of their church as invested with divine authority, receiving his revelations as the word of the Lord. They maintain the doctrines of repentance and faith, a literal resurrection of the dead, the second coming of Christ and his reign upon earth (having the seat of his power in their territory), baptism by immersion, baptism for the dead, and polygamy as a sacred duty for all those who are capable of entering into such marriage. The Mormons settled first at Kirtland, Ohio, then in Missouri, and after their expulsion from these places in Nauvoo, Illinois; in 1847-8 they removed to Utah, and have since spread into Idaho, Arizona, Wyoming, etc. They have frequently defied the United States government. There is also a comparatively small branch of the Mormon Church, entitled "The Reorganized Church of Jesus Christ of Latter-day Saints," which is opposed to polygamy and is ecclesiastically independent of the original organization. Also *Mormonist*, *Mormonite*.—**Book of Mormon**, one of the authoritative writings of the Mormon Church. According to the Mormons, it is the record of certain ancient peoples in America, abridged by the prophet Mormon, written on golden plates, and discovered by Joseph Smith at Cumorah (western New York), and translated by him. By anti-Mormons it is generally regarded as taken from a romance written about 1811 by Solomon Spaulding, whose manuscript was used by Smith and Rigdon.

(a) By Bonaparte and most others it is restricted to those species which have well-developed dorsal and anal fins more or less nearly opposite each other but of varying extent, and a well-developed caudal remote from the dorsal and anal. It includes all but one of the scyphophorous fishes. (b) By Günther it is extended to include the foregoing, together with species without an anal or caudal fin placed by other authors in the family *Gymnarchidæ*. All have the body and tail scaly, head scaleless, margin of the upper jaw formed in the middle by the intermaxillaries, which coalesce into a single bone, and laterally by the maxillaries. The interoperculum is sometimes rudimentary and on each side of the single parietal bone is a cavity leading into the interior of the skull. The family contains a number of fresh-water African fishes, representing several genera, some of which are remarkable for the prolongation of the snout. There is also great diversity in the development of the dorsal and anal fins, in some cases these being much lengthened and in others very short. *Mormyrus oxyrinchus* is common in the Nile. Also *Mormyri*.
